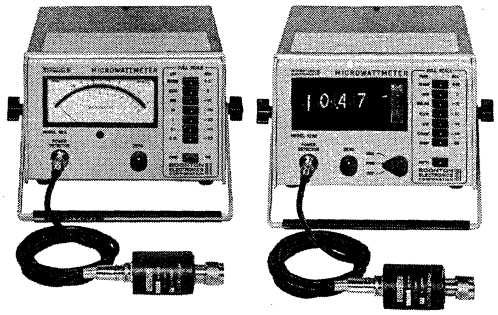
RF MICROWATTMETERS



Model 42A Model 42AD

Model 42 Series

The new Model 42A and 42AD Microwattmeters are exceptionally sensitive programmable MF to K band (200 kHz to 12.4 GHz) power meters that virtually eliminate zero drift and temperature stability problems.

Three coaxial power detector heads, two 50 Ω and one 75 Ω, are available. Each measures the full power range of from 1 nW to 10 mW with an overload rating of 0.3 W cw. The 75 Ω head for CATV applications has a frequency range from 200 kHz to 1 GHz.

Long-term absolute accuracy of the combined instrument and power detector is specified to allow the power meter to be used without frequent calibration checks.

Analog and digital readout versions are available. Digital readout of dBm is optional on the Model 42AD.

The dc output on both versions and the additional BCD outputs on the digital version are standard.

ADVANCED PULSE GENERATORS

Chronetics' Pulse Generators represent the most versatile and wide-range instruments in the pulse generator field. Eleven standard models, all solid state, meet most user requirements.

Repetition rates from 0.1 Hz to 100 MHz, output amplitudes from 0 to ±100 volts or ±2A, rise/fall-times of less than 2 ns, wide dynamic ranges, high duty cycles, bipolar outputs, etc. are all available on standard instruments.

Chronetics Pulse Generators are exceptionally flexible. Most provide single or double pulses of either polarity, single-shot, pulse bursts. Bipolar outputs and current/voltage modes are available. Usually prf, amplitude, risetime and falltime, width, delay and DC-offset are independently and continuously variable.

Price/performance engineering makes Chronetics Generators best buys in the pulser field. Prices begin as low as $375* for the compact, rugged and high-performing PG-11. Sales/Service is on a world-wide basis with more than 45 field offices to respond promptly to any need.

ELAPSED TIME INDICATORS

... Smallest size, lowest cost, AC or DC, any voltage

How they work — The patented Curtis Ampere Hour Meter is basically a mercury microcoulometer fabricated from precision bore, glass capillary tubing filled with two columns of mercury separated by a small electrolyte gap. Application of pure or pulsed DC signals to electrodes inserted in the mercury causes mercury at the anode to be electrochemically transferred across the gap to the cathode at a time rate proportional to the current. The gap moves along the tube length as a function of the current-time integral. A constant-current supply provides a precision timing device.

TYPICAL APPLICATIONS

Warranty — Low-cost meters for warranty of equipment based on both actual usage, and calendar period.

Reliability Engineering — Provides mean-time-to-failure or sub-system replacement time without costly, unreliable logging.

Test Equipment Utilization & Calibration — Provides calibration on actual hours of use with savings up to 50% compared to calendar-basis programs. Substantial savings in capital investments can be realized with accurate utilization data on test instruments, tools and equipment.

In between, the computer-aided design program checks your logic drawings for loading errors and missing signals and eliminates the thousand and one headaches associated with building a system to a tight schedule.

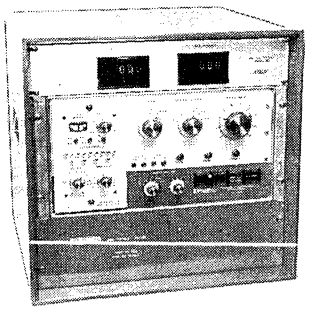
SERIES 202

HIGH SPEED STROBING VECTOR COMPUTING SYSTEMS

For pulsed or CW measurements of Complex Impedance, Admittance, Phase, Transfer Function and Power



FEATURES:

- Computing time less than 1 cycle after sample
- Computes real and imaginary components, phase and magnitude
- Measures CW, gated CW or rapidly varying AC signals
- Selectable sampling times — 0.5 to 500 ms
- Single burst measurements — sample and hold outputs
- Analog and Digital readouts
- Plug-in concept for broad versatility
- Internal delay to eliminate transients
- Differential measurements for high accuracy

APPLICATIONS:

- Automatic high speed testing of components
- Measurement of electro-acoustic transducers under low and high power
- Use as phase-lock detector for low level signal bursts
- Analysis of acoustical fields
- Measurement of real and imaginary input power

The 202 Vector Computing System provides real time computation of vector components, phase and magnitude, requiring only a single sample of the AC test signal and AC reference for measurement. Direct reading digital and analog displays are produced, with provision for connection to X-Y or strip chart recorders or digital computers.

Consisting of a Model 202 or 202A Main Frame, a selectable plug-in and a readout unit, this system can be used for direct computation of impedance, admittance and transfer function under a wide range of voltages, currents and frequencies.

Its rapid computing speed is designed for simultaneous graphic recording of all four outputs, and is particularly useful for frequency plotting or complex immittance plane recording. Yet its sample and hold outputs are excellent for single burst measurements. Measuring on external command, this system is well suited for automatic high speed testing of components as well as complete network analysis.

VECTOR COMPUTER MAIN FRAMES 202 and 202A

Heart of a 202 system is the Vector Computer[1] Model 202 or 202A. The Model 202 accepts two normalized AC signals from the plug-in, producing DC voltages proportional to real and imaginary components. In addition, the Model 202A also produces simultaneously DC voltages proportional to magnitude and phase. Utilizing a unique sampling and integrating technique, effects of noise and harmonics are considerably reduced as compared to systems which utilize peak reading techniques for magnitude and zero axis crossings for phase.

PLUG-INS:

Plug-ins 202-PA-2505 and 202-PA-2506 are for general purpose use, and complement each other to cover a frequency range of 100 Hz to 10 MHz. Each consists of a plug-in section and a probe unit, with 10 ft of cable. Model 202-PA-2505 measures up to 5,000 V rms, and is completely programmable by computer. Model 202-PA-2506 covers the complete 150 kHz to 10 MHz band without frequency band switching.

Both units are capable of the unique Dranetz differential admittance measurement as well as impedance and transfer function. Both plug-ins also provide auto-ranging of the DVM's on the Model D12 readout.

READOUTS:

Two panel readouts are available. Model D10 provides two 5" analog meters, mounted with accessory circuits, on a 5¼"-high panel for 19" rack mounting. Model D12 (shown in photo) consists of two direct reading digital meters, with BCD outputs mounted on a 3½"-high panel for 19" rack mounting; 3½ digits; operates from 115 V 60 Hz power; TTL, DTL, 8421.

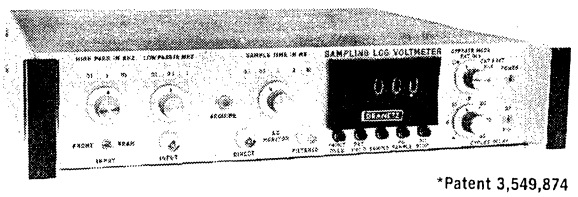
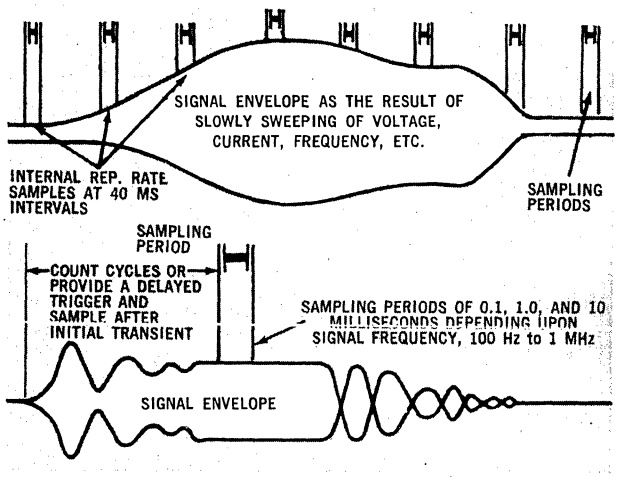
SERIES 220
HIGH SPEED LOG SAMPLING VOLTMETER *

Direct digital readout of CW, Gated AC, or rapidly varying AC signals



*Patent 3,549,874



FEATURES:

- Frequency range - 100 Hz to 1 MHz
- Sample and hold output - analog and digital outputs
- Single or repetitive measurement to 1000 samples per second
- Sampling times down to 100 μsec
- Output independent of sampling time or duty cycle
- 84 dB dynamic range - 300 μV to 5 V (to 5 kV with voltage probes)
- Logarithmic digital display and BCD outputs

APPLICATIONS:

- High speed component testing
- Analysis of time-varying or transient effects
- Measurement of direct or reflected acoustical signals
- Measurement of signal burst levels applied to radiators or receivers.

The Model 220 Sampling Voltmeter is a gated, average responding voltmeter for measuring amplitude of AC signals during a short sampling time. Measurement can be made of rapidly varying CW signals, gated AC signals (tone bursts), or single shot AC signals. Measurements are made at any predetermined time in a selected period which can be as short as 1 cycle of the signal.

Sample and hold output circuitry, combined with internal logarithmic conversion, provide several simultaneous outputs: a digital panel meter reading directly in DBV (ref: 0 DBV = 1 V rms), a linear DC output, two logarithmic DC outputs, and a logarithmic digital output (BCD code) corresponding to the digital panel meter reading. Provision is made for insertion of an external DC signal which allows both the digital display and BCD output to correspond to other logarithmic parameters without effecting instrument calibration.

This instrument combines internal low and high pass filtering, a unique average responding detector, and logarithmic conversion to offer an exceptionally wide dynamic range, high sensitivity, wide frequency range, short sampling time and low susceptibility to noise and signal distortion compared to peak responding and rms AC instruments.

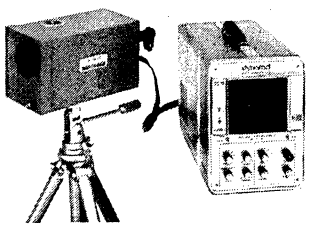
dynarad™ INC.

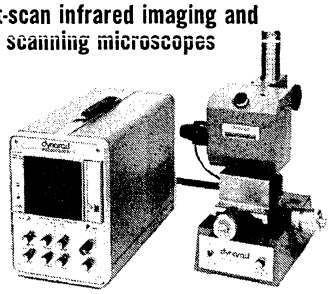
is first in infrared instrumentation to solve thermal measurement problems

fast-scan infrared cameras — model 200 series



Offers the lightest, smallest, lowest cost general purpose infrared imaging system available. The equipment measures the temperature of a target within a 10° x 10° field-of-view and presents these measurements on the face of a cathode ray tube at an effective frame rate of 60 frames per second thus providing a real-time television-like display. Temperature differences, from background, as low as 0.2°C with precise accuracy are achieved. Many variable and optional features are available including higher spatial resolution for long ranges, narrow fields-of-view, variable and multiple detector systems and choice of detectors. Instantaneous and continuous measurement of the thermal behavior of target areas is easily performed thus dispensing with the tedious thermocouple type of sensors used in process control. Other applications include target signature recognition and identification, CO_2 laser imaging, as a night vision device, fault location in electronic circuit boards, fire detection, power utility line inspection, personnel intrusion, exotic material security, ecology measurements. The system is available in various configurations such as a line scanner or combination thereof.

fast-scan infrared imaging and line scanning microscopes

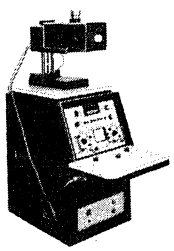


Dynarad's Model 301 Infrared Imaging Microscope and Model 500 series infrared line-scanning microscopes are the only general purpose devices of their type. The scanners measure the temperature of a target within a scan line and present these measurements as a flicker-free analog trace on the face of a cathode ray tube at a rate of at least 60 lines per second. The difference in the four models lies either in the width of the scan line or the repetition rate and whether a complete image is presented or not. Each system provides a spot size of 0.001 inches and is in two separate packages: an optical scanning detection head and a display unit. The display allows the use of an intensity marker for accurate temperature measurement of the object surface. The optical scanning and detection head weighs under 10 pounds and is only 180 cubic inches. This head is mounted on a stand allowing for both coarse and fine focusing adjustments. A coaxial viewing channel is provided within the optical head for focusing and general target observation. An x, y micro-positioner mounted on the base of the stand allows for orientation of the target field. The infrared microscopes were developed to portray and examine the temperature distribution over the surface of transistors and integrated circuits for fault location and to perform failure analysis investigations.

MAC-IRIS

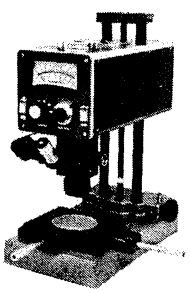
A SUBSIDIARY OF DYNARAD, INC.

infrared scanner — model 802



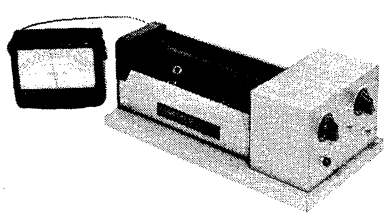
The MAC-IRIS Model 802 system consists of an infrared camera and microscope combined in a single instrument. It performs many useful functions ranging from basic research to the resolving of thermal problems connected with but not limited to product reliability, quality control, failure prediction, and non-destructive testing and evaluation of semiconductors, printed circuit boards, and integrated circuits. This versatile precision instrument presents real-time, TV-like thermal profiles (images) and line scan capabilities. It offers continuously variable scanning rates in both the vertical and horizontal direction — slow rates for the highest possible definition of targets and faster rates for real-time viewing and following thermal transients. The Model 802 contains variable fields-of-view in both the IR camera and microscope modes of operation thus affording the equipment to adapt to the target's dimensions. The system's display modes are normal picture presentation, up to seven separate isothermal lines or bands, a vertically displaced oscilloscope line trace representing target radiant intensity. The target radiant intensity could also be displayed on a meter or digital readout.

high speed thermal microplotter — model 725



The MAC-IRIS Model 725 is a high precision infrared microscope for non-contactive temperature measurements of microcircuits. It is ideally suited for non-destructive analyses in the fields of semiconductors and IC chip product reliability and quality control. Some of its salient features are thermal resolution of 0.2°C from below ambient to 250°C, response time of 0.5 milliseconds, choice of direct or differential readout, a chopper-stabilized amplifier for drift-free performance, built-in illuminated visual channel, choice of 10X, 15X, 36X and 74X objectives, choice of manual or automatically scanned substages, and an optional temperature calibration source ranging from ambient to 600°C.

ir decade calibration source — model 905



The MAC-IRIS (a subsidiary of DYNARAD, Inc.) Model 905 Decade Black-Body Calibration Source as a standard provides continuous black-body infrared radiation over any decade temperature range from 0°C to 350°C and is extendable to 600°C. This self-contained, unique design permits precise calibration of infrared radiometric equipment in the laboratory and in the field. Absolute temperature measurements from 0.05°C to 35°C differentials can be readily and precisely controlled in ten equal steps in conjunction with an L & N potentiometer with an ice point reference or with a point source black-body.

infrared spatial resolution chart

The MAC-IRIS's resolution chart is a standard for calibrating the spatial resolution in infrared scanning devices. As an analogy, the MAC-IRIS resolution chart is to the IR scanning device industry as the RETMA resolution chart is to the television industry. The unit consists essentially of a temperature controlled back plate and a front plate containing milled cutouts of specially designed geometrical shapes.

HIGH PERFORMANCE PULSE GENERATORS

The pulse generator is a basic tool for requirements as diverse as solid-state research and development and production line testing. The E-H pulse generator line, which has made us a leader in pulse technology, provides models for specialized applications as well as general-purpose applications. For example, the Model 129 is used in high-speed digital logic testing, and is capable of driving the fastest digital circuits. Until the Model 129 was introduced, no practical commercial pulse generator offered repetition frequencies beyond 200 MHz. The Model 129 offers 500 MHz, 2 volt pulses with less than 500 ps risetime and has such valuable features as adjustable baseline offset, baseline/pulsetop inversion logic, and synchronous gating. The Model 135 could be characterized as the "universal" pulse generator because of its great versatility, full waveshape control, and capability for handling any pulse requirements today and for some time to come. The Model 135 is the only 50 MHz pulse generator available with complete waveshape control, selectable gate on/gate off

For those applications requiring high performance on a limited budget, the Model G 710 is just the thing. This unit offers 50 MHz pulse repetition frequencies, less than 5 ns rise and fall times, and normal and complement outputs with 5 V amplitude into 50 ohms. In addition to these features, the Model G 710 offers low pulse distortion, and a switch-selected internal 50-ohm termination to eliminate mismatch and reflection problems. To simplify maintenance, the Model G 710 was designed with no internal adjustments, and does not require periodic recalibration.

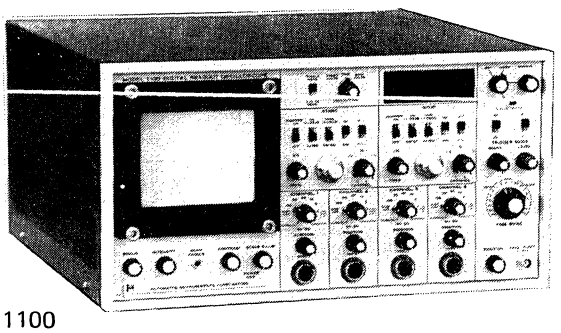
measurements to the field of high-performance sampling oscilloscopes. The Model 1100 is the only sampling oscilloscope available today with all these features: 1 GHz bandwidth, four-channel, four-trace capability, and digital readout. With its simple, easy-to-read display the 1100 enables sophisticated pulse and rf waveform measurements to be made by relatively untrained, non-technical personnel. In addition, the four-trace capability allows digital logic designers to see *and* to make quantitative measurements on waveforms at both "0" and "1" flip-flop outputs, input and OR/NOR outputs of gates, etc.



AMC 1100

The Iwatsu Model SS-311 is currently the only realtime oscilloscope offering 300 MHz bandwidth together with all such desirable features of low-frequency oscilloscopes as delayed sweep and dual-trace presentation. The SS-311 also features 1 megohm input impedance for direct connections and 10 megohm input impedance with the passive divider probes supplied. High sensitivity (10 mV/cm), combined with a high writing rate CRT, makes it easy to photograph low-level single waveforms.

For applications requiring oscilloscopes that combine performance with portability, the Iwatsu Model SS-200 offers 200 MHz bandwidth, dual-trace operation, and delayed sweep in a package weighing only 28 lb. This versatile oscilloscope is just the thing for field service of computers, radio communications equipment, avionics equipment, or test systems.

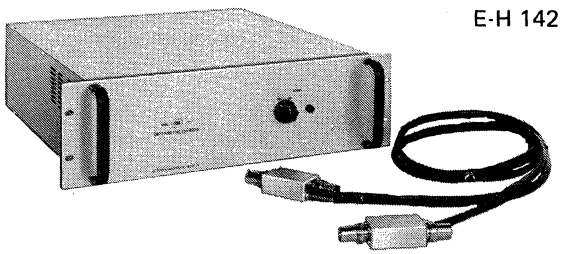
PROGRAMMABLE SYSTEM COMPONENTS

ANALYSIS MODULES

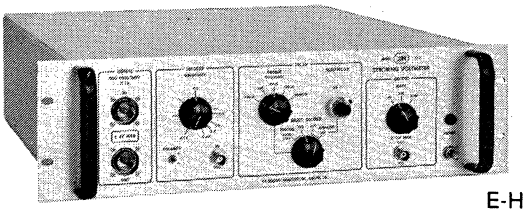
The measurement, or analysis portion of an automated test system is vital in determining system performance. The analysis units must measure response waveforms accurately and consistently, and in addition, must be completely programmable and capable of operating at high testing rates.

The E-H programmable units presented here meet all of the above requirements and offer additional features for a wide range of system applications.

E-H 142



The **E-H Model 142 Switching Time Converter** is an economical solution to the problem of measuring nanosecond time intervals in automated systems applications. Using the single-shot technique, the Model 142 provides an analog output which is easily converted to digital form. Full-scale time ranges of 1 ns, 10 ns, 100 ns, and 1 μs, provide adequate range for any test system application.



E-H 153

Voltage-sensing remote discriminator units are used to generate start/stop pulses that define the time interval to be measured. Each discriminator is separately programmed by a dc voltage equivalent to the required start and stop thresholds. When the signal at the discriminator input reaches a level equal to the programmed dc level, the discriminator generates a control pulse which is sent to the main converter unit. The selected start/stop pulse pair is used to control a converter circuit which generates a pulse whose amplitude is proportional to the measured time interval.

STIMULUS MODULES

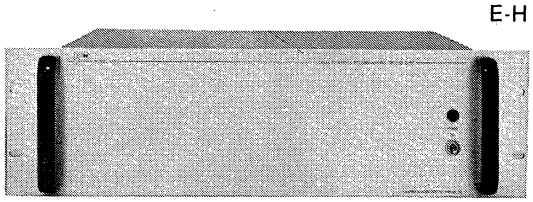
In a fully-automated test system, the programmable drivers are an important part of the stimulus/response measurement portion of the system. Unless the drivers are capable of complete waveshape control, and provide output pulses with linear transitions, and low pulsetop distortion, assurance of predictable device response becomes difficult.

The E-H line of programmable drivers and timing units provides precisely what the system designer needs for every test system requirement.

The **E-H Model 1422 Programmable Timing Unit** provides a wide range of pulse parameters for system timing and stimulus applications. The Model 1422 was designed with ECL testing specifically in mind but with enough flexibility so that it can be used as a timing unit for pulse drivers, such as the E-H Model 1139, and for other system applications. The output pulses will vary in amplitude from less than 0.8 V to over 2 V, with an offset that will vary from zero to −2 V. The output pulse has a programmable polarity of positive normal or positive inverted.

An internal clock provides triggers to two independent channels of width and delay to give output pulse repetition frequencies from 1 kHz to 100 MHz. By programming one line per channel the internal clock can be inhibited from triggering either one or both of the delay and width channels.

E-H 1422

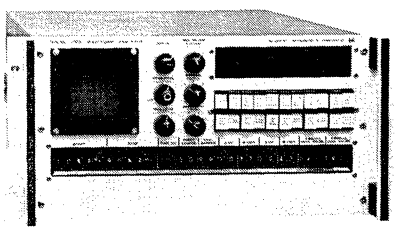


The **E-H Model 1030/1033 Six-Pak Pulse Driver** is a compact, three-unit plug-in combination containing six 1-ampere output channels, each with independent amplitude, polarity, and linear rise-fall time controls. Designed to operate at repetition frequencies up to 5 MHz from an external drive source, the Model 1030/1033 features separate automatic overload protection for the output of each operating channel.

The instrument is modular in design, with the Model 1030 Power Unit containing six separate regulated power supplies. The Model 1033 Dual Ramp Unit (three dual units

The **E-H Model 153 Strobing Voltmeter** brings new simplicity to the realm of amplitude measurement in automated systems. On a single waveform, the Model 153 samples the voltage amplitude at a preprogrammed time (strobe time) with respect to the system clock, generates an analog output proportional to the signal amplitude at strobe time, and holds the measurement long enough for conversion to digital form or for analog comparison.

Using a balanced diode-bridge gate, the Model 153 isolates its 50-ohm feed-through signal line from the measurement circuitry. This gate is opened by a strobe signal for several nanoseconds at the end of a controlled delay period. The voltage on the signal line at the end of the strobe time is processed through a fast FET memory amplifier. A second strobe then applies the output of the first memory amplifier to a second memory amplifier, which amplifies and stretches the signal to a level suitable for processing by external equipment. An external trigger signal starts the measurement cycle; once the cycle has been initiated, the trigger-recognition circuit is blocked for approximately 1 millisecond. Output gain is available in three decade multiples of the input, x1, x10, and x100, with an output range from −10 to +10 volts.



AMC 1000

The **AMC Model 1000 Waveform Analyzer** offers high-speed, programmable measurement capability for automated test systems or laboratory bench use. This unique instrument is the heart of programmable waveform measurement systems and converts dc as well as sub-nanosecond ac signals to digital data. This data may then be processed by the rest of the system for classification, data logging, or go/no-go decisions.

The Model 1000 combines the functions of sampling oscilloscope, digital counter, and digital voltmeter to provide time and voltage measurements of sampled waveforms. At programmed points on the waveform, reference levels are established to provide a basis for comparison with successive measurements. Start and stop points for time measurements are referred to these reference levels, either in percentage of the levels or in actual voltages with respect to them. A normal measurement cycle consists of two successive sets of samples made on a repetition waveform. In the first set of samples, reference levels are established by memory circuits. In the second set, comparator circuits start and stop the counter when the signal coincides with preset start and stop levels. If a voltage measurement is required, the internal digital voltmeter measures the voltage difference between the reference levels on the sampled waveform.

The **E-H Model 1223 Programmable Timing Unit** offers extended stimulus generator capability to the systems designer, with 50 MHz repetition frequency capability and high-resolution pulse width programming. Six independent channels generate fast-rise pulses with widths programmable from 10 ns to 1 ms. Either 50-ohm or high-impedance logic

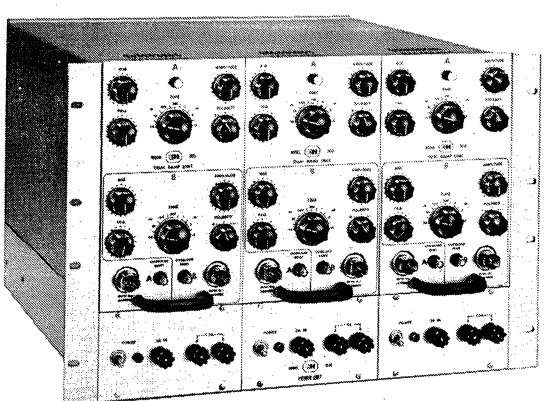
level trigger signal sources may be used to drive the Model 1223. Channels may be series-connected to give programmable delay for systems timing applications.



E-H 1030/1033

Two outputs are provided for each channel. A negative-going trigger output is coincident with the output pulse leading and trailing edges and may be used to drive external equipment or one of the other channels for delay generation. The main pulse output is a +2.5 V pulse with risetimes less than 4 ns and falltime less than 5 ns. Both trigger and main pulse are 50-ohm, coaxial outputs.

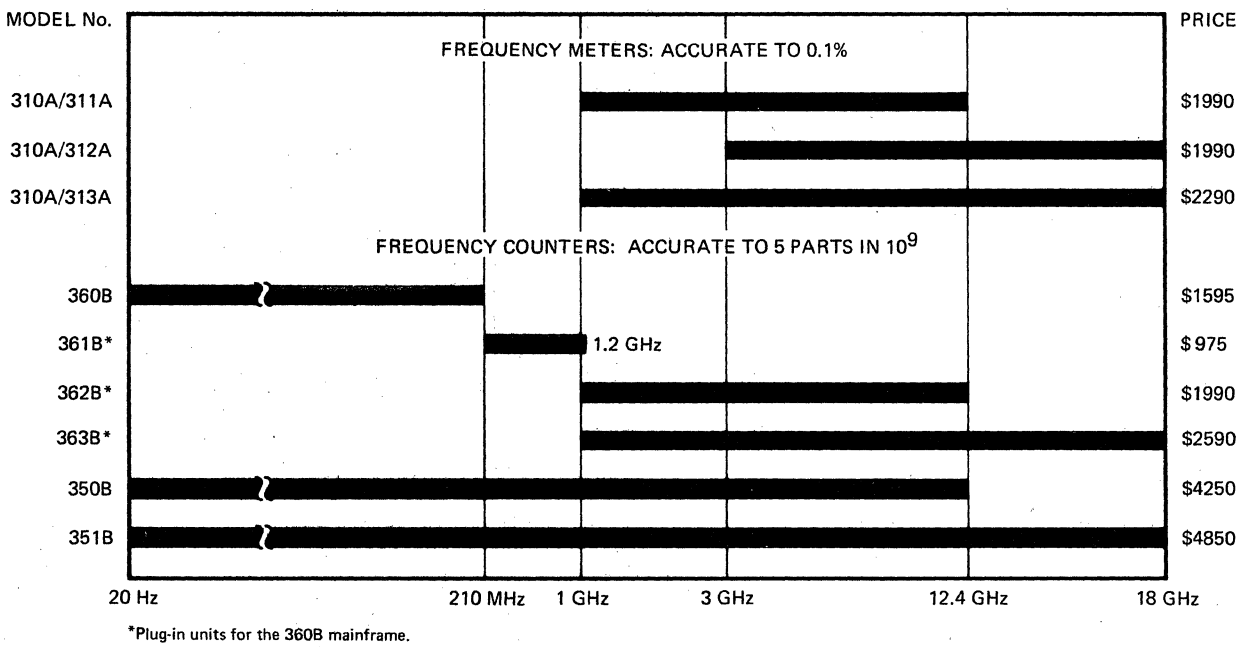
EIP Frequency Measurement Selection Guide 20Hz to 18GHz



*Plug-in units for the 360B mainframe.

These are the instruments that measure frequency automatically. You just connect the input signal; if the signal is within the frequency and amplitude range, the counter will measure it. No tuning. No sensitivity adjustments. No gate time to set.

You'll still get your reading even if your signal has substantial FM or noise. There are no restrictions on the input signal, except frequency and amplitude range.

And because they are designed specifically for frequency measurement, EIP instruments are extremely easy to read. The counters have an eleven digit display that is conveniently sectioned in GHz, MHz, kHz, and Hz. You read the frequency directly to 1 Hz resolution. The frequency meters have a five digit display with 1 MHz resolution.

Your local EIP field representative will be glad to give you more information. Or contact us directly at 2353 De La Cruz Boulevard, Santa Clara, California 95052, (408) 244-7975/6.

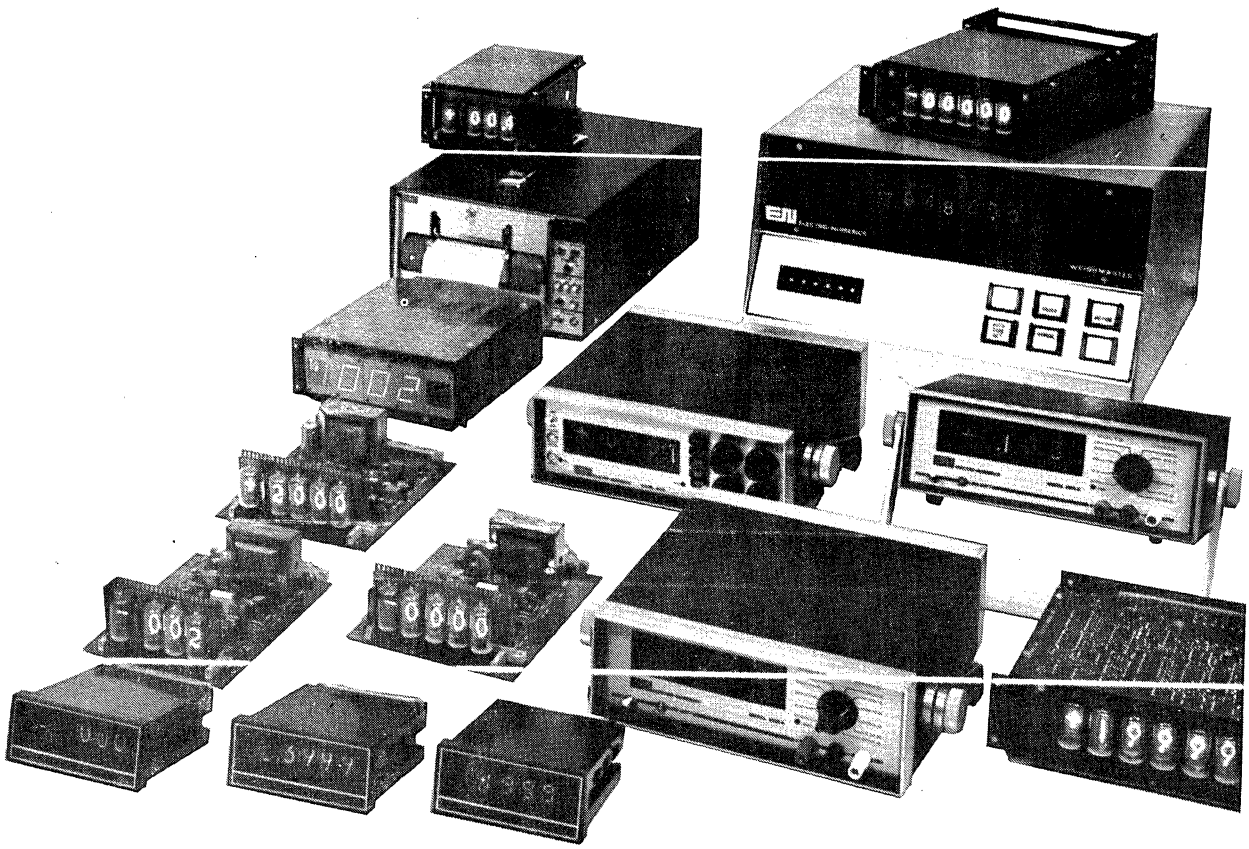
COOL, STABLE, RELIABLE



Last year we were shipping a dozen different kinds of digital panel meters, plus printers, DVM's and digital transducer meters — in production quantities. Our option list was the best in the industry: Peak retention, BCD, Limits, preamps, wide range offset, battery operation, remote readout, AC, and more. We electronically cycled every unit for 96 hours at 65°C and then warranty them for two full years. Our customer reported an average field failure rate of less than 4% over the preceding 24 months — We're better now!

e|s|i® precision test and calibration instruments

ESI produces a comprehensive line of instruments, standards and system components for the precise measurement of resistance, voltage, capacitance, inductance and ac/dc ratio. The full spectrum of critical application is covered: standards and laboratory calibration, design work, production and field test.

All calibrations on ESI instruments are traceable to the National Bureau of Standards through ESI transportable reference standards. These standards are test reported by NBS and maintained by ESI. They form the base from which our professional grade instruments derive their warranted accuracy.

For more complete information than given here, please request our comprehensive metrology catalog.

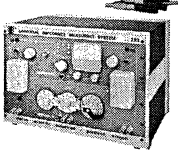
300A PVB® Potentiometric Voltmeter Bridge

The Model 300A Potentiometric Voltmeter Bridge provides a complete five-dial dc measurement facility in one convenient battery-operated instrument with 0.01% accuracy, 2 μV sensitivity.

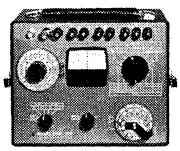
The PVB® combines the functions of a five-range potentiometric voltmeter, three-range precision voltage source, eight-range ammeter, ten-range guarded Kelvin double bridge, four-terminal 0.01% resistance comparison bridge, ratiometer and high-sensitivity electronic null detector.

A modulator-type null detector with an integral high-gain solid-state amplifier provides better than 2 microvolts dc sensitivity with an input impedance of approximately one megohm. Exceptional rejection of ac pickup by the detector, coupled with complete guarding and shielding, makes possible accurate measurements in noisy electrical environments under conditions of high humidity. Long battery life provides complete flexibility of measurement by isolating the instrument from annoying ground loops and power line transients.



293 Universal Impedance Measuring System

Measures resistance and conductance (0.05% accuracy), inductance and capacitance (0.1%) in five figures of direct, in-line readout, plus D or Q. Detector sensitivity of 5 microvolts; variable output generator. Self-contained, ac/dc generator-detector. Front panel terminals.



250 DE Portable Impedance Bridge

Measures R, at 0.1%, C and L at 0.2%. Includes solid-state ac/dc detector and generator; operates on four 1.5V D batteries. Terminals provided for external bias, range extension. Measures dissipation factor and storage factor for capacitors and inductors. 12,005 divisions of dial resolution.

Resistance Measurement

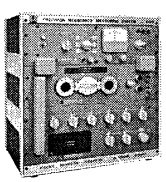
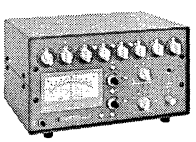
232A	Wheatstone bridge, gen.-det.	1.2Ω to 12 GΩ	0.01%	**1575.**



242D Resistance Measuring System

Most versatile system at 10 ppm direct readout accuracy. (5 ppm can be specified as an option.) Four-terminal comparisons to 1 ppm, with 0.1 ppm resolution. Matched generator-detector with complete guarding and shielding provides easy operation over wide range (10 microhms—120 megohms). Data logging available, as is less accurate, less expensive Model 242B.



263 Resistance Deviation Bridge

Ideal production bench instrument for determining cutoff point when winding wire resistors; also to measure adjustment of metal film resistors and networks, or in rapid testing or sorting of discrete resistors, using the two analog limits. Responds within few milliseconds at 0.02% accuracy from 1 ohm to 100 megohms. Eight decades resolution; 4-terminal guarding and high ac rejection. Individual resistors within network can be measured. Less expensive Model 262 available without built-in standard.

Voltage and Capacitance Measurement

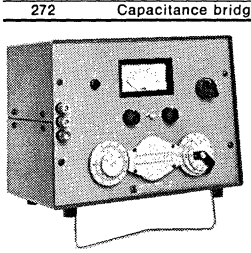
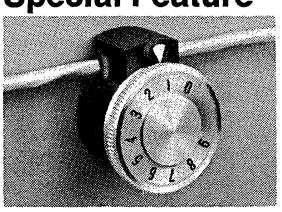
272	Capacitance bridge, improved dissipation resolution	120 pF-120 μF (0.01 pF resolution; 0.0001 dissipation resolution)	0.1%	**950.**



272 Capacitance Bridge

Offers lower D and C ranges (0 to 0.0105 at 1 kHz and 0 to 120 pF) plus greater D resolution (0.0001 at 1 kHz) than its sister, the Model 273. In addition, it has better D accuracy (0.0005) while maintaining the same C accuracy of 0.1%. Highest of the instrument's seven C ranges is 0 to 120 microfarads. All types of capacitors, including electrolytic or tantulum varieties, may be checked.

Special Feature



New DATA-DIAL easily adapts calibration instruments for automatic data logging. Simple knob replaces all decade switches on front panel of your calibration equipment. Each DATA-DIAL contains circuitry and wiring for digital output. Take off old knob, put on DATA-DIAL without removing panel, dust cover or exposing switch decks. Costs only $35.00 per dial.

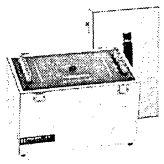
esi® Standards



SR 104 Transportable Resistance Standard

Calibration to 1 ppm accuracy is available on this 10-kilohm standard. Unique features include stability of 0.5 ppm/yr after two years and a temperature coefficient of less than 0.1 ppm/°C. It also is available at 1000-ohm and 100-ohm values and, as the Model 105, in the classic enclosure that permits oil bath immersion.

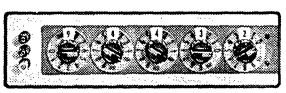
Working Standards

Many of the decade and divider standards offered in the ESI catalog can be special ordered in a programable version. Most accuracies and ranges can be obtained with either binary of BCD coding. Contact repeatability and reliability are outstanding, due to the use of latching mercury-wetted relays throughout.

RV 726 DEKAVIDER Decade Voltage Divider

Self-calibration, 7-decade Kelvin-Varley circuit provides 0.1 linearity, 0.1 ppm resolution and outstanding performance at low settings. Temp. coefficient of ± 1 ppm/°C. RV 722 is a 7-decade, 1 ppm non-trimmable unit.



DB 52 DEKABOX In-line Decade

Resistors used for precision dc and audio frequency. Low temperature, power coefficients; minimal leakage. Six-dial DB 62 also available.

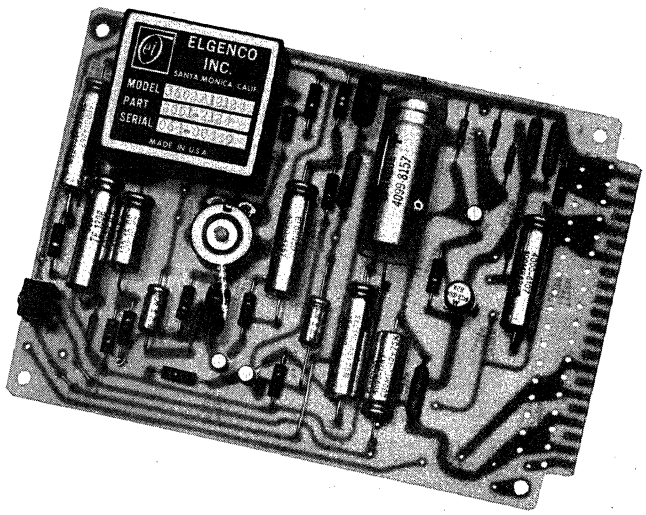
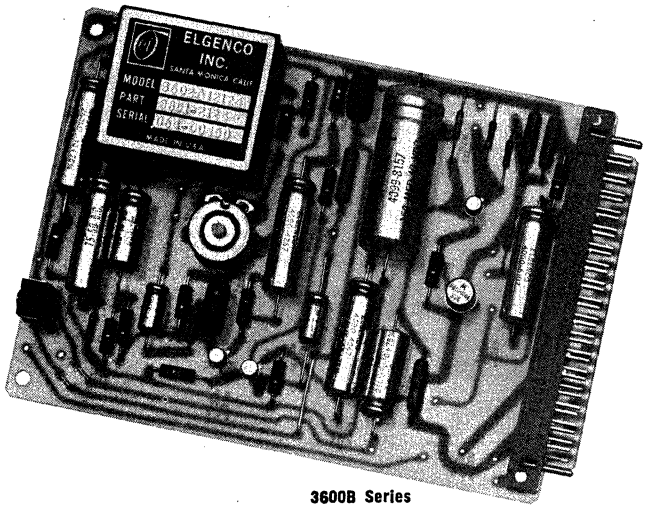
SERIES 3600 FIXED RANGE • NOISE GENERATOR CARDS



3600A Series



3600B Series

SPECIFICATIONS

FREQUENCY RANGE: The frequency band may be any combination of the listed low and high frequencies.

Lower Frequency: 10, 20, 50, or 200 Hz, 5 kHz.

Upper Frequency: 20, 50, 100, 200, or 500 kHz; 1, 2, 3, or 5 mHz.

SPECTRAL UNIFORMITY: Spectral uniformities are available as:

Upper Frequency	Spectral Uniformity
20 kHz to 500 kHz	±0.5, ±1.0, ±2.0 or ±3.0db
1 mHz to 3 mHz	±1.0, ±2.0, or ±3.0db
5 mHz	±2.0 or ±3.0db

As a rule of thumb, the roll off above the specified upper frequency gives a 3db point about twice the specified upper frequency. Roll off above 3db point approaches 12db per octave. Spectral uniformities in the midband are typically flat to better than ±0.5db.

OUTPUT IMPEDANCE:

20 kHz to 500 kHz units .....600 ohms
1 to 5 mHz units .....200 ohms

POWER REQUIREMENTS:

	3600A Series or 3600B Series	Low Current Option 3600A or 3600B	3600C Series

1. Tension member assures constant band tension while absorbing shock and vibration to prevent band breakage.

2. Strong taut-band eliminates friction and will withstand heavy shock and vibration without damage.

3. Pole piece design assures uniform flux density from 0 to 250° deflection for better tracking.

4. Unique balance weight design assures proper balance even after heavy shock and vibration. No weight wires to shift as on other meters.

5. Large berrium ferrite magnet provides 40% more flux density than other "core magnet" designs for better torque.

6. Movement is suppressed slightly against stop peg to eliminate zero adjust. Pointer is always at zero in any position.

digital multimeters and voltmeters

A New Approach to the Digital Voltmeter

Fluke digital multimeters and voltmeters are the first instruments to use the recirculating remainder analog to digital technique. This circuit discipline results in a number of benefits which, in total, yield the most reliable, flexible and lowest cost family of digital voltmeters and multimeters ever built. Among them are low parts count for reliability, fast speed for easy systems use, high common mode and normal mode rejection for excellent isolation and total quality of measurement, low power consumption for reliability and portability, and isolated data output with an easy to convert BCD code with DTL and TTL logic levels. Timeouts, flags and serial acquisition make the recirculating remainder technique the most systems compatible. Most options can be added in the field at any time.

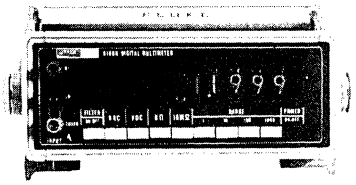
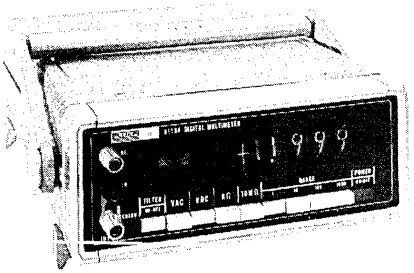
Digital Multimeters, Models 8100A, 8110A, and 8120A

The Model 8100A 0.02% Digital Multimeter measures AC and DC volts in four ranges to 1200 volts. Ohms are measured in five ranges to 12 megohms. Optional rechargeable battery pack provides true portability. Polarity indication is automatic. An active two pole digital filter provides more accurate measurements of noisy DC. Four full digits plus "1" for 20% overranging are offered. All functions are push button selectable.



For increased accuracy at a modest increase in price, Fluke offers the Model 8110A. Measurement capability and other features are the same as the Model 8100A with these exceptions. The model 8110A is guaranteed to remain within specification without recalibration over a broad temperature range for six months. Six month accuracy for DC is ±(0.01% of reading + 0.02% of range). AC and resistance accuracies are ±0.2% and ±0.02%.

The Fluke 8110A won't fail when you overload it. Take off the overload and the instrument returns to normal. Weighing only 10 pounds, the 8110A gives you true portability for up to eight hours continuous operation with the optional rechargeable battery.



Newest digital multimeter in the Fluke line, the Model 8120A, is especially well suited for both the field and lab applications. In addition to measuring AC, DC, and resistance in the same ranges as the Model 8100A, the Model 8120A has 100 mV AC & DC ranges and measures AC and DC current.

DC current can be measured in five ranges, 0.1 ma, 1 ma, 10 ma, 100 ma, and 1000 ma with 20% overranging to an accuracy of ±(0.15% of reading + 0.15% range)/year. AC current can be measured over the same ranges and overranging to a midband accuracy of ±(0.3% reading + 0.2% range)/year. In both cases 100% overload can be handled on each range.

The AC/DC high voltage probe permits measurements up to 5000 volts with a ratio accuracy of 2%/year. A dual range clip-on current sensor can be used to measure currents from 0 to 10 amperes or 0 to 100 amperes DC or AC to an accuracy of ±0.5%/year.

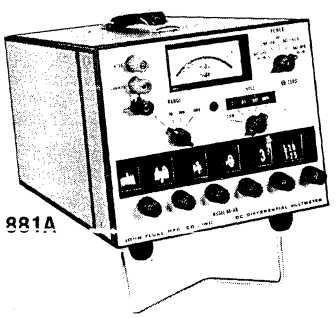
Model 883A



Model 881A

Fluke solid state AC/DC and DC differential voltmeters offer the widest range for performance and accuracy in the market. Most units operate from either internal rechargeable batteries or 115/230V, 50-440Hz line power. Battery power is essential for measurement where maximum accuracy demands complete line isolation. Input ranges are 1, 10, 100 and 1000V each with 10% overranging. Fluke differential voltmeters are electrically and mechanically designed to perform under the extremes of temperature, shock, vibration and humidity. The internal reference voltage is developed from matched zener diodes that are selected to establish excellent stability, tracking and temperature coefficient parameters. Fluke manufacturers all of the precision wire-wound resistors used in these instruments. The all solid-state differential voltmeters are lightweight for portability. They are provided with a tilt-back bail, or functional detented handle for operator convenience. Recorder output is available on all Fluke differential voltmeters. All Fluke differential voltmeters accept 115 or 230 VAC.

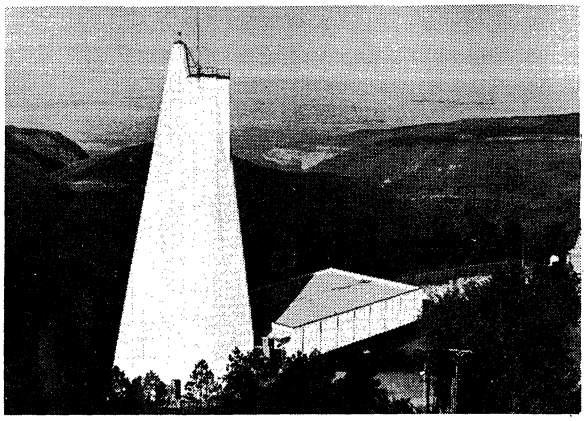
PRECISION INSTRUMENT SYSTEMS AND EQUIPMENTS

COMPLETE INSTRUMENT CONTROL SYSTEMS



MOVABLE TURRET ASSEMBLY & CONTROL SYSTEM SACRAMENTO PEAK OBSERVATORY

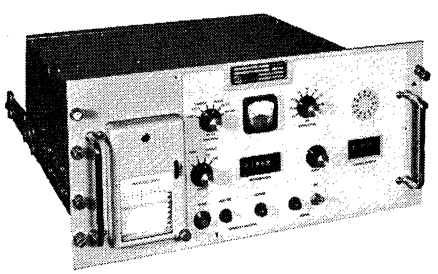
The Air Force Cambridge Research Laboratories' Sacramento Peak Vacuum Telescope is a vivid demonstration of the Company's depth of diversified talent and systems capability.

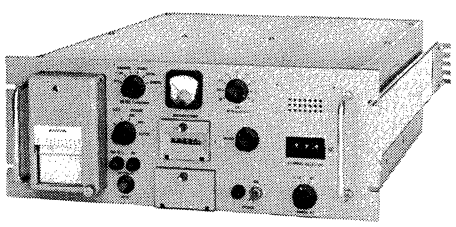
This telescope, with associated instrumentation and electronics, is located at Sunspot, New Mexico, 9200 feet above sea level. It stands 136 feet above ground level and extends 221 feet into the heart of the mountain.

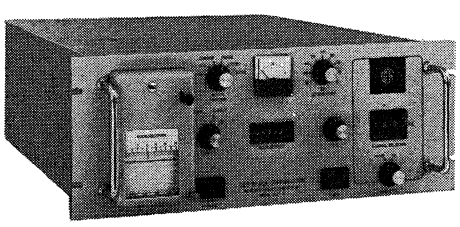
The instrumentation and electronics furnished by Geo Space Systems, Inc., will serve as the operating controls of the telescope. It is designed to auto-track or track on a programmed basis, the sun, other stars or planets and will enable scientists to learn more about the physical composition and activity of these bodies. The instruments can provide continuous automatic compensation for the rotation of these bodies with respect to their celestial coordinates during all tracking phases. One hoped-for result of these studies will be the ability to forecast accurately solar flares. This ability will be of great importance to world-wide communications and to space programs.

The GSS role in this program involved design, production and installation of an optimum switched, non-linear servo control system to drive the 10,000 ft/lb torque motor which rotates the 230 ton evacuated optical tube forming the lower part of the telescope; and the servo control systems operating the upper turret section and its precision components, including solar-optical error detectors yielding auto-track accuracy within 30 arc sec. GSS also built and installed the large spectograph and the Echelle spectograph.

TIME/FREQUENCY CONTROL EQUIPMENT

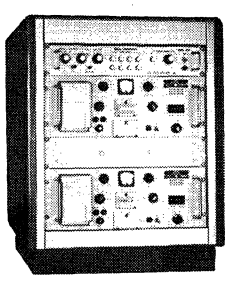






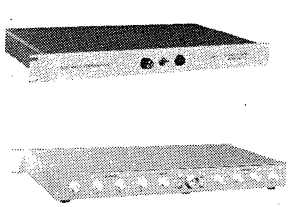
GSS VLF RECEIVERS

The GSS VLF receivers are designed for precision phase monitoring of VLF stations or rating of local standards. They are also capable of monitoring the new Omega stations when used with a suitable commutator. Characteristics are standard inputs of 100 kHz or 1 MHz, tuning range of 10 to 30 kHz in 50 Hz increments, mechanical or electronic servo, .006 Hz servo bandwidth, 10 nanovolt sensitivity and a built-in chart recorder for read-out. Units are line operated with optional DC standby input available.



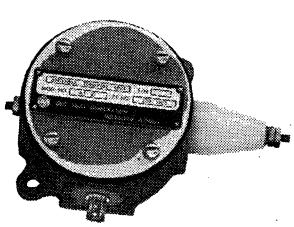
OMEGA SYSTEM

The Omega Navigation System provides navigation for ships and aircraft with excellent accuracy. Results are obtained with readouts of "lane crossings" and an analog position voltage. Suitable outputs are also provided for interfacing with a computer for more sophisticated readout and data analysis.



VLF ANTENNA MULTICOUPLER

This multicoupler can reduce such problems as desensitization, phase shift, cross-coupling interference, and coherent ground circuit interference. Input impedance is 50Ω, with 8 independent 50Ω outputs featuring 50 db isolation, and a gain of 3 db.



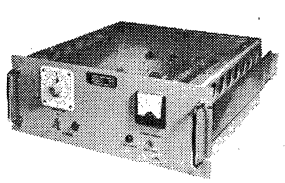
VLF LONG-WIRE AND WHIP ANTENNAE

The AT-10 long wire antenna and matching network provide excellent VLF reception, and allows use of a 50Ω coaxial transmission line.

The WA-10 whip antenna excels in areas of heavy horizontally polarized man-made noise.

COHERENT SIGNAL GENERATOR

This instrument furnishes a stable and controllable input signal for complete, rapid testing of performance characteristics of VLF receivers, including sensitivity, stability, accuracy, time constant and lag, deadband, noise rejection, adjacent channel rejection, intermodulation distortion, image response, and desensitization. The reference and the GSC-12 outputs are simultaneously monitored by the receiver under test, yielding data that is an absolute measure of the receiver's response.



BATTERY POWER SUPPLY

The GSS standby battery power supplies have been designed to furnish emergency DC power to critical equipment when primary AC power fails. Stable output voltage is obtained from nickel-cadmium batteries for long periods. Integral circuits provide fast and trickle charge. In the fast charge mode, batteries are restored to full charge in less than 8 hours. Full voltage life is dependent upon Amp/Hour rating of batteries supplied and the load current. Indication of approximate charge status is provided by a front panel meter and indicator lights.

As a leading manufacturer of standard frequency correlation and time signal synchronization equipment, Geo Space Systems, Inc. has successfully met the growing needs for time synchronization between geographically separated stations.

With its equipment serving the U. S. Army, Navy, NASA and FAA, and by meeting their stringent requirements, Geo Space is continually expanding its efforts to develop new approaches and instrumentation in this field.

- Surge and transient protection on all meters, transformers etc.
- Circuit breaker input.

SERIES RESONANT TYPES FOR CAPACITIVE LOADS

Series resonant AC insulation/dielectric test sets involve a revolutionary new approach to capacitive load testing. Each system consists of a variable inductor, a high voltage transformer, and an exciter supply. The heart of the system is Hipotronics' own variable inductor, consisting of a patented steel core reactor with a variable air gap. The required input power is only 5 percent of the output KVA requirements. i.e. To test at 3000 KVA, would require a system input of only 150 KVA. For more information on series resonant testing, write for brochure HP 7109.

CORONA TEST

To insure high reliability and long life, all equipment is tested to Hipotronics' specification #2514 or #2515. These specifications require a corona detector with a basic sensitivity of 1 picocoulomb per centimeter.

OPTIONAL EXTRAS

- Corona Detection Equipment: Any AC or AC/DC units may be supplied with Hipotronics' own advanced corona detector as part of an integrated system. See bulletin HP 7110 for features and prices of Hipotronics' Corona System.
- Motorized output control, single speed.
- Motorized output control with 10 to 1 range of adjustment.
- Burn feature — bypasses overload and inserts line reactor in series with HV transformer primary.
- Multi-pi secondary — quadruples secondary current capability at quarter output, doubles at half output, thus increasing test capacity.
- DC output channel for 1.3 or 2.6 times AC rating, with current capability of 10 ma.
- Test fixtures and jigs to meet any ASTM, UL, MIL, CSA, or customer specification.

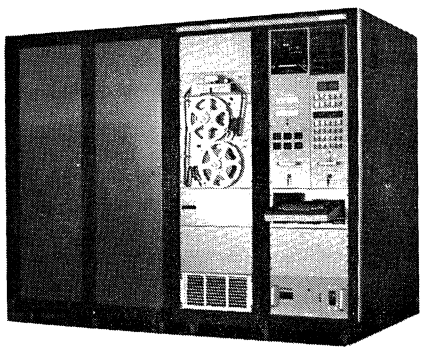
FACT

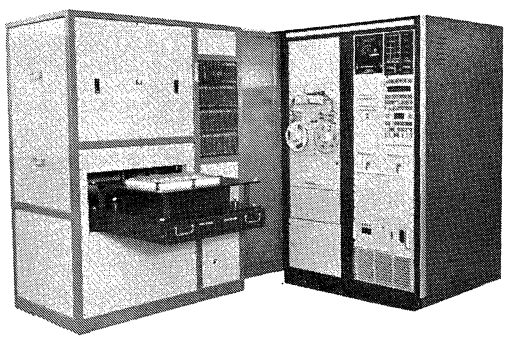
(FLEXIBLE AUTOMATIC CIRCUIT TESTER)

SYSTEMS APPROACH TO WIRE ANALYSIS

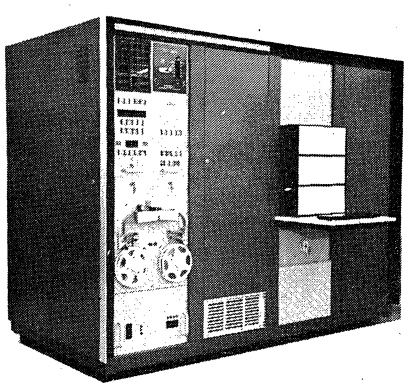
High Speed Circuit Analyzers, Fixturing, Cable Adapters and Facility Layouts customized to meet your requirements. Test systems provide greater productivity, assure product validity and better return on investment.



The Hughes FACT-II (Flexible Automatic Circuit Tester) is a versatile, high speed test system, completely programmable with random access modular switching, for automated continuity and leakage testing of complex wired assemblies, computer backplanes and multilayer printed circuit boards. Punched tapes supply programmed test instructions. Test speeds are 4000 tests/minute for continuity and 2000 tests/minute for leakage. Test capability can be enhanced to meet peculiar test requirements by system expansion and inclusion of optional equipment.



Hughes Semi-Automatic Spring Probe Fixtures are integrated with many FACT Test Systems to provide the user with the capability of rapidly interfacing printed circuit boards, multilayer boards and the wiring side of backplane wiring panels. Completely automated handling systems are available to meet your specific needs.



LIFT (Low Insertion Force Technique) adapters are commonly used with FACT Test Systems to provide customers with a quick means of adapting to the connector side of wired backplanes. The product is loaded with extender cards and the entire unit is then inserted into the LIFT connector panel with almost zero force. Any number of connections can be made simultaneously by operation of a pneumatic bladder. Quick interconnect/disconnect enables off-line product hook-up or rework resulting in optimum use of the analyzer.

PHAZOR

The operation of the Phazors is unique in that the input and reference signals are applied to an electronic multiplier which derives the instantaneous product of their amplitudes. The multiplier output is then applied to a DC meter which produces a deflection proportional to the time average of this product.

Expressing this function mathematically we have: Meter Deflection = $\frac{k}{T}\int_0^T V_S \cdot V_R \, dt$

JULIE RATIOMETRIC® SYSTEMS

In Julie approach, use is made of very accurate resistance and voltage references. A voltage divider is used with associated circuitry, switches and a null detector, to interpolate and extrapolate the values of these references. Total measurement errors are reduced, very simply, to those produced by the voltage divider (usually 1 ppm f.s. at worst), switching and hook-up (usually 1 or 2 ppm) and reference voltage or resistance (1 ppm to typically 10 ppm for resistance).

The key to the Ratiometric™ approach is the stable Kelvin-Varley voltage divider. (See the table that follows.) Although the Kelvin-Varley divider was invented over 100 years ago, it was not used in high precision applications because of accuracy limitations. With the radical improvement in the accuracy of the Kelvin-Varley divider by Loebe Julie, founder of Julie Research Laboratories, Inc., the previously unrealized advantages of this divider were harnessed. Background information is available for the asking from the Julie Research home office in New York City.

These pages list only a basic sampling of Julie products. We welcome your request for detailed information.

ATS-106/20 "MINI-AUTOMATOR" • AUTOMATED CONTROL, MEASUREMENT AND DATA LOGGING SYSTEM

A significant advance has been made in universal interfacing of programmable instrumentation with the development of the new Julie ATS-106/20. This system may be used with any equipment using 10-line decimal or BCD program format, and provides an immediate interface with any computer or other data-handling equipment equipped with a "Teletype" input/output channel. The ATS-106/20 includes a modified Teletype keyboard, automatic paper tape punch and reader and specially designed digital logic cards. It can easily be auto-programmed and is capable of completely controlling measuring and data logging by itself, or it can be controlled etc. by computer.
The ATS-106/20 makes it feasible for all manufacturers to compete in today's market place by deviating from the previous tendency toward expensive dedicated designs.

Prices start at $14,000. Detailed specifications and engineering assistance are awaiting the inquirer. Also ask about our scanners and other remotely-controlled instrumentation.

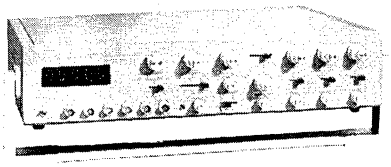
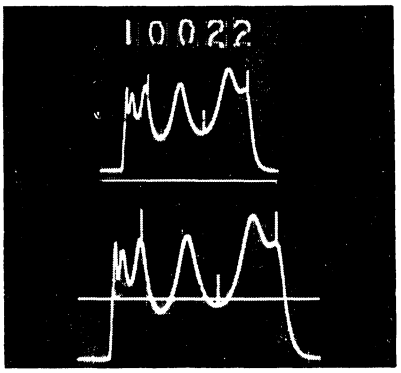
Marker Generators KAY

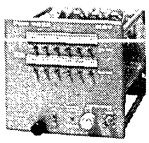


NEW MODEL 8323A FREQUENCY MARKER COUNTER PROVIDES VARIABLE PULSE MARKERS TO 7 SIGNIFICANT DIGITS

8323A: This all new ultra-state-of-the-art instrument teaches your "Old Dog" sweeper a "New Trick" — How to count! The 8323A works with any old dog or new VCO sweep to provide both a counter (DC-115MHz) and three independent, continuously variable pulse markers that can be read out individually to counter accuracy. Designed to facilitate precision passband marking and sweep and point setting, each frequency marker can be read out as desired with the flick of a switch. Marker height, width, and direction (horizontal for sharp slopes) are controlled on the front panel. A variable, horizontal line provides easy reference for amplitude calibration. Works with Kay sweeps or others.

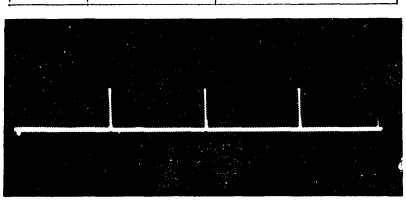


■ Pulse Marker Plug-Ins

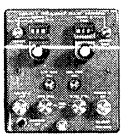


PCM7631, PCM7632, PCM7633, PCM932 (1500C system), PM7650 (154C, 159D systems): These plug-ins are precision pulse marking systems which accept multiple, crystal-controlled, markers at customer specified frequencies. Each marker or marker group is controlled by a simple front panel switch. The individual pulse marker is sharp enough to remain narrow and well defined even on extremely narrow sweeps.

Model	Freq. Range	No. of Markers
PCM7632	1KHz—1MHz	6 + External Variable
PCM7631	10KHz—2MHz	6 + External Variable
PCM7633	1KHz—110MHz	12 + External Variable
PCM932	2MHz—220MHz	31 + External Variable
PM7650	1MHz—110MHz	8 + External Variable

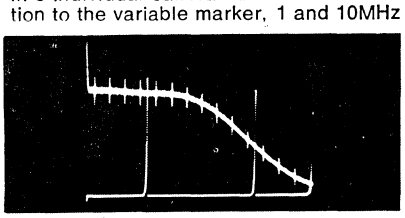


■ Variable Marker Plug-Ins

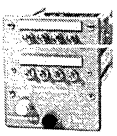


PM100, PM300: These new plug-ins provide two, accurate, variable pulse markers for use with 154C and 159D sweep generators. Both models also include individually controlled 1 and 10MHz crystal marker arrays. The variable pulse markers thus may be used as calibrated end point markers and passband markers. Individual amplitude controls adust marker size up from the base line for accurate gain marking. New PM600 for 160A

PM7670: The model PM7670 is a new fundamental frequency marker module which develops a direct-reading variable birdie marker for use with the Kay model 154C, 159D and 1500C sweep systems. It covers its 300KHz—300MHz spectrum in 8 individual calibrated bands. In addition to the variable marker, 1 and 10MHz

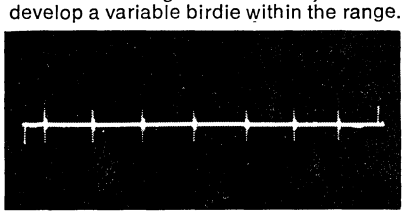


■ Birdie Marker Plug-Ins



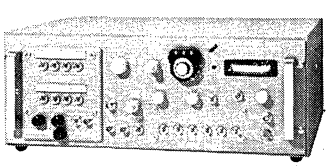
harmonic markers and a CW output are provided. An optional 4.5MHz crystal sideband marker may also be specified. For the model 1500C system, specify PCM7670.

PCM861, PM7660: Designed for use with the 1500C and 154C and 159D respectively these plug-ins offer either individually switched single frequency and/or harmonic birdie-pip markers as specified. The PCM861 produces up to six markers in the 200KHz—1GHz region. The PM-7660 allows up to eight indicators in the 500KHz—300MHz range. All markers are held to .005% crystal accuracy. Variable level controls are included and an external CW signal can be injected to develop a variable birdie within the range.



154C - 159D: These up-to-the-minute versions of Kay's 154 and 159 are completely solid-state, electronically swept, wide-sweep and marker generators which cover their ranges in a single wide sweep. The additional features of continuously variable sweep width and multiturn digital frequency dial provide exceptional fine touch settings over the video, IF and VHF range. The use of a broad output amplifier in these beat frequency units permits light coupling of the mixed oscillators, thus providing high RF levels with superior waveshape; distortion and spurious are minimal.

Performance characteristics include line lock, CW, manual, wide variable sweep rates, and external modulation input. Frequency range may be swept from HI to LO or from LO to HI as required. Automatic leveling may be controlled either externally or internally. A built-in detector and precision sweep attenuator are standard features. Both models are available in 50 or 75Ω impedance. In addition, a full compliment



159D

of pulse, birdie, and variable marker plug-ins are available for use with these instruments. These modules are described above.

Freq. Range	Model No.	Sweep Width	RF Output	Flatness	Markers	Features

KAY WIDEBAND SWEEP AND MARKER GENERATORS

Kay Elemetrics Corp. has introduced a new sweep generator, the 160A, which provides a full one volt RMS output into 50 ohms over a 1 MHz to 600 MHz frequency range.

The sweep generator itself features continuously variable sweep widths and center frequency over the 600 MHz range. A multi-turn center frequency control includes a direct-reading, digital frequency dial for fine setting of narrow sweeps and superior readability and settability.

Performance characteristics include line lock, variable repetition rates, CW, manual, external modulation and switchable, blanked retrace. A triangular sweep output, synchronized with the RF output, is available for triggering the horizontal axis of an oscilloscope. A built-in precision RF step attenuator provides up to 79 db of attenuation plus a 6 db variable.

The RF output is AGC'd flat for amplitude linearity of better than ±.25 db over the widest range. Careful shaping of the electronic modulating circuits provide for controlled, meaningful frequency linearity. Distortion and spurious are minimal. The use of a broad output amplifier in these beat frequency units permits light coupling of the mixed oscillators, gives high output with superior waveshape. The price of the sweep is a low $1,195.00; markers are optional at additional cost.

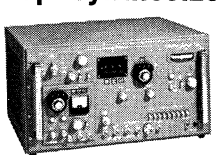
Frequency Markers: Harmonic birdie crystal combs at 1, 10, 100 mHz. Variable, "triangular", pulse marker from 50 kHz to 100 mHz.

Blanking: zero reference blanking on retrace.

Kay has developed a new sweeper, Model 1520A, that covers the frequency range from a low 50 kHz to 1200 mHz without plug-ins. At video and IF frequencies from 50 kHz to 100 mHz, a variable frequency pulse marker offers frequency counter readout and accuracy. A low-frequency video band provides cw or full sweep from below 50 kHz to 10 mHz using circuits designed for frequency stability and low residual FM at video frequencies. A second, scaled-up, video range provides 1 to 300 mHz, full sweep or cw. Four additional, overlapping bands at fundamental frequency cover 255 to 1200 mHz, cw or sweeps to at least 40% of center frequency. A six-band, slide-rule frequency dial is provided and crystal harmonic markers at multiples of 1, 10, and 100 mHz cover the entire range of the unit. A special circuit is provided for an especially effective narrow sweep mode, provision is made for inserting external oscillator marker signals, and a detachable RF detector is included.

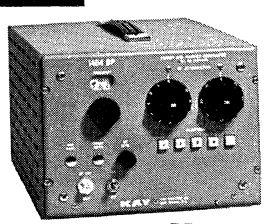
Sweep Synthesizers



101A

101A: The model 101A is a sweep synthesizer which provides not only the solid-state 100 MHz wide sweep capability of Kay's proven 154C (see above) but also superb, low residual, narrow sweep features essential for steep-skirted, narrow band filter applications and for the design and production of pin-point frequency discriminating circuits. In addition it provides a new order of swept and cw stability, of narrow-band frequency marking, of calibrated (0.01%) cw output frequencies, and of digital/analog programmability through the use of newly developed IC synthesizer circuitry. The price at around $3000 for a unit that includes a "locked" range of 100 KHz to 100 MHz is a fraction of the cost of the usual synthesizers.

KAY PRODUCTION SWEEPS FOR RADIO, TV, ETC.



1484 BP

1483B: The new 1483B is a solid-state sweep and marker generator used to design, test, and align UHF-TV receivers, it develops a full 0.5 volt rms output into load over the entire channel 14 to 83 frequency range. A front panel control permits switching of the sweep width from a wide 520 MHz (entire UHF-TV band) to continuously variable widths from 60 down to 5 MHz.

1484BP: New, compact units for production type applications feature push-button band switching of both sweeper and marker outputs. Markers are pulse of birdie pip, sweeps are ALC'd flat and linear, standard models at FM IF, FM RF, VHF TV frequencies. Frequencies to 1GHz to order. Excellent narrow sweep units feature level controls free from frequency pulling. Wide sweeps to an octave at all frequencies and wider at many (e.g. 40 — 230MHz single sweep TV), low cost, repeatable, stable.

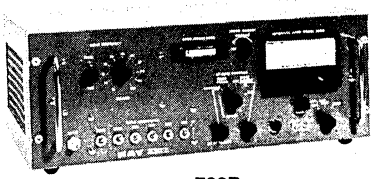
KAY AUTOMATIC NOISE FIGURE METER



792B

- TUNED IF INPUT AMPLIFIER (NO SPURIOUS READINGS
- BROAD 10-1000 MHz SOURCE (NO CHANGING SOURCE IN MID-BAND)
- OPTIMIZED IN PRICE AND PERFORMANCE FOR 10-1000 MHz RANGE
- NOISE MEASUREMENTS TO 26.5 GHz
- 75Ω MEASUREMENTS FOR CATV COVERAGE

The 792B is a sensitive, solid-state, noise figure meter. Primarily focused on the frequency range below 1000 MHz, this instrument provides better accuracy and greater flexibility at considerably less cost than conventional noise generators. The 7921A hot wire noise source is a unique broad band generator and operates over the full 10-1000 MHz range.

Provision is made for later addition of noise sources covering the range to 26.5 GHz. In this way, an expanded applications requirement can be met without the full expense or added space demands of an additional unit.

Additional noise sources provide variable impedance and balanced VHF outputs from temperature-limited diodes, waveguide output from argon gas tubes

Either 6 db or 15.2 db excess noise outputs can be selected for increased accuracy at low or high noise figures, respectively.

This wide coverage eliminates the inconvenience (and the inaccuracies) of changing noise generator source in mid-band, as is usually required.

INPUT FREQUENCY: 10-120 MHz Continuous Coverage

BANDWIDTH: Approx. 4% of Center Frequency

INPUT SENSITIVITY: 0 to 75 dbm (noise source on). Approx. 35 db gain required between lowest noise source & input.

INPUT IMPEDANCE: 50 ohms nominal

INPUT ATTENUATOR: Steps of 20, 10, 5, 3, 2, and 1 db.

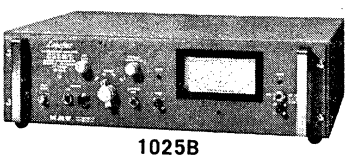
A NEW CATV CHANNEL SELECTED INPUT AMPLIFIER IS NOW AVAILABLE FOR THE KAY 792. IT OFFERS 15 PRESET CHANNELS AT THE FOLLOWING FREQUENCIES: 10, 20, 30, 55, 67, 83, 121, 133, 157, 175, 195, 211, 239, 257 AND 275 MHZ. SPECIFY MODEL 793A.

KAY RANDOM NOISE GENERATORS

240, 403, 780: These models are calibrated random noise sources providing output over a wide frequency and power range. They employ noise diodes with tungsten filaments as temperature-limited noise generators. The plate voltage of the noise diode is regulated and the diode plate current, (proportional to noise power output), is variable by a front panel control. A calibrated meter provides direct reading in noise figure. The ability to vary the noise output in an accurately known way, greatly simplifies the measurement process since it permits precise matching of circuit noise rather than a more complicated referencing back to some fixed output.

Model	Frequency	Features
240	5-220MHz	0-23.8DB Noise Figure
403	3-500MHz	0-19DB Noise Figure
780	1-3GHz	0-20DB Noise Figure

AMPLIFIERS KAY



1025B

1022A, 1022A PF, 1023A, 1024A, 1026A: These amplifiers include new wide-band models with excellent gain-bandwidth characteristics, (40 db - 150 MHz, 30 db - 300 MHz), and a high output 8 MHz unit delivering 15 volts rms into 50 ohms. Each of these amplifiers has unusually flat response over its full frequency range. Each is designed for accurate input and output impedances of 50 ohms, but can operate an accessory probe to provide amplification from high-impedance outputs without loading down the test signals.

For high impedance application, the 965A broad-band probe is designed for operation with these 50 ohm input amplifiers.

1025B: The 1025B gives overall response, and at the same time gives detailed, easily seen measurements of points on the curves as far down as 80 db. The unit permits highly accurate viewing of the skirts and sharp slopes of bandpass filters, single side-band filters, traps, etc. A control gives expansion of the top critical points simultaneously with the log display. 80 db log range, also available as undetected RF signal.

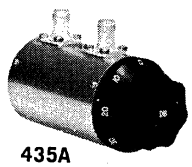
KAY

PRECISION ATTENUATORS



435A

Kay in-line and rotary attenuators are designed to provide a means of inserting an accurate and fixed amount of loss in circuits operating in the DC-12.4 GHz range. Attenuation is controlled by field-proven high-frequency toggle switches. Solid silver contacts set in Teflon for low loss and superior match are employed throughout. The precision resistors used are 1% tolerance, carbon film resistors. The maximum total error is very low and incidental insertion loss is negligible. These units have met rigid environmental tests and are traceable to N.B.S.

The individually-switched steps are isolated in broad-tuned, shielded compartments, providing high accuracy and a flat frequency response over the specified range. All models are symmetrical, (bi-directional), attenuators. Most models are available in either 50, 75, or 90 ohms.

To afford maximum utility, Kay in-line attenuators are available for your special built-in applications. These attenuators are ideally suited for inclusion in a wide variety of equipment, such as test equipment, IF amplifiers, receivers, etc. In general, the electrical specifications are the same as for the in-line model. They differ, however, in mechanical configuration.

For automatic testing, new programmable, precision attenuators controlled by logic level inputs and powered by the 50/60 Hz AC line (or optional 400 Hz), are offered in cool-running, compact, low-cost units. One nine line model offers 0 - 135 db in one db steps over a DC to 1300 MHz range; a second offers 0 - 132 db in one db steps for the DC to 4 GHz range. A smaller four line unit provides 0 - 90 db in ten db steps from DC to 6 GHz.

These are designed for rapid switching time (20ms/line), frequent cycling, extremely low insertion loss, and high-accurate, repeatable, wideband attenuation. All the superior RF characteristics of the Kay manually operated in-line attenuators have been incorporated (plus double RF shielding) and the same specifications have been maintained.

Each line controls an individual, electromechanically switched attenuation pad. These can be combined to form a single, high-attenuation line and can be supplied for special values, BCD sequencing, etc. The electro-mechanical switching draws power *only* during the switching period. Line control current drain is very low. For logic level operation, the input impedance is 1000 ohms and 2 to 5 V dc sets ATTENUATION ON, 0 to 1 V dc sets ATTENUATION OFF. For contact closure control, a shorted line sets ATTENUATION IN and draws approximately 4 ma.

The RF attenuation is furnished as a complete, self-contained unit and can be replaced for system changes and long term maintenance. As on the manually operated attenuators, individual, switched attenuation pads can be replaced.

DC — 12.4GHz

KAY

A new group of switched, coaxial attenuators is now available to span the DC - 12.4 GHz range. Developed from Kay's precision VHF - UHF attenuators, these devices eliminate the cumbersome technique of inserting and reinserting individual pads or the need to go thru a time-consuming rotary step-cycle.

Individual attenuation steps are controlled by finger operated, spring-loaded slide switches. These models consist of a complete coaxial system. Each segment is constructed with air dielectrics, and fine silver contacts insuring precision surfaces. Individual steps are isolated in broad-tuned, shielded compartments.

A variety of models is available to provide customer specified attenuation and frequency ranges covering the 0 - 132 db — DC-12.4 GHz range. Standard models are listed on the attenuator chart; many attenuators in this series are available in single coaxial pads, two or three step versions or special versions to suit customer specifications.

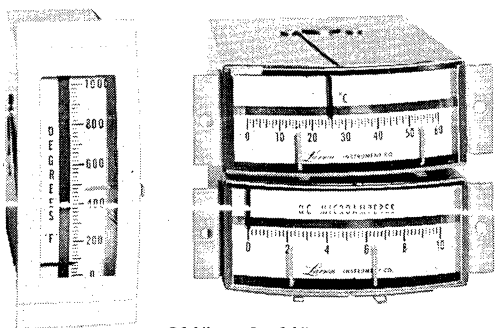
- Overall depth, ONLY 3.95"
- No moving wires — no failures
- Continuous indication beyond set point
- Fail-safe circuit
- Repeatability ¼%
- Relay contacts 10 Amps 115V
- Amplifier for 115V AC or 24V DC input

For your design, we have a selection of styling and sizes. The Wide Vue, available in 2.5", 3.5" and 4.5"; single or dual limits. Shadow box optional.

The Space Saver, in 2.5" and 3.5", for vertical or horizontal mounting; single or dual limits.

Space Saver



2½" and 3½"

The method of operation is an optical system, consisting of a miniature light source with a life expectancy of 100,000 hours. Each set pointer is equipped with a photo-electric sensing device. The indicating pointer has a segment which actuates the sensing elements precisely at the control point. They will remain actuated anywhere beyond the set point.

Control is established by means of a transistorized electronic circuit. The transistor amplifier and load relay are continuously energized up to the control point. In the event of power or light failure, the fail-safe circuit will de-energize the relays.

In the Larson Meter Relays, we designed for you, **our** Customer, modern styling, incorporating components obtaining top reliability...to give **your** Customer the best in Quality.

Inkless Event Recorder

The Larson Model ROS instrument will continuously record the time, sequence and duration of as many as 30 different events on one chart. The record is made on electro-sensitive paper, by a stylus which marks only when current flows through the paper. The recording is instantaneous, accurate and permanent.

RESPONSE and **RESOLUTION.** The recorder can remain on stand-by for an unlimited length of time, yet be ready to respond within 1 Millisecond when a signal is applied. The instrument will record up to 60 pulses per second for each stylus. Response time of the styli is 1 Millisecond.

CHART SPEEDS. Are available for ½" per hour to 10" per second. Standard speeds are ½", 1", 2", 3", 4", 6", 8" and 10" per hour, minute or second.

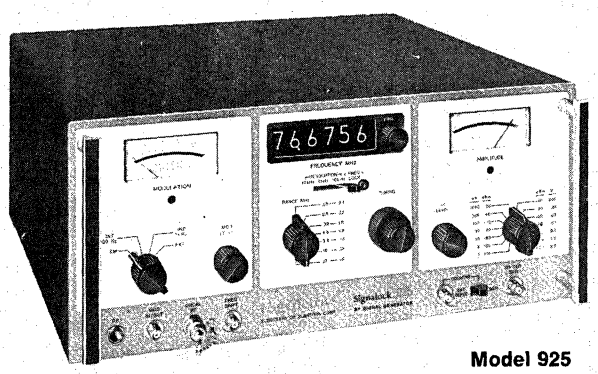
LogiMetrics solid-state RF signal generators with built-in frequency counter



Model 925

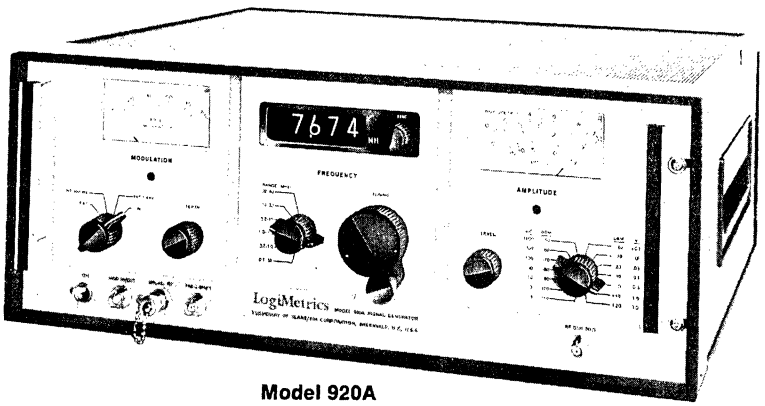
LogiMetrics patented "Signalock"™ provides synthesizer stability in a standard signal generator

- LogiMetrics generators contain a patented, direct reading, built-in electronic frequency counter that provides a higher frequency accuracy at any setting. This exclusive feature eliminates the usual frequency dial mechanism found in conventional generators where tuning backlash and oscillator dial tracking problems exist.
- LogiMetrics generators provide a high range of leveled RF output, with extremely good spectral purity and modulation characteristics.
- Functionally related controls and an easy-to-read digital display make LogiMetrics RF Signal Generators the easiest to use in industry.

The Model 925 "Signalock" RF Signal Generator covers the frequency range from 50 kHz to 80 MHz. The patented "Signalock" feature locks the generator's fundamental RF oscillator to the built-in frequency counter's crystal time base to provide a frequency stability of ±10 Hz. The 925 electronic frequency counter has a 6-digit "NIXIE" readout with an external input to enable measurement of external signal frequencies to 80 MHz with 100 Hz resolution.

In addition, the 925 contains all of the RF output and modulation characteristics of the "standard" LogiMetrics Model 920A RF Signal Generator.

LogiMetrics Standard AM generators are easier to use

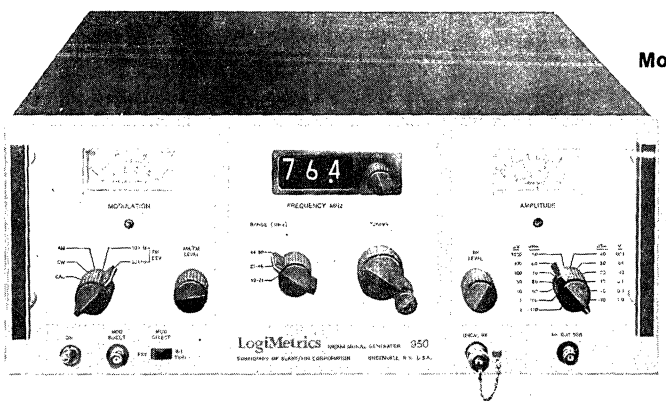


Model 920A

Model 920A. Covers the range from 100 kHz to 80 MHz with a 4-digit NIXIE frequency readout. The RF output is calibrated from 3 volts to 0.1 microvolt and leveled to within ±0.5 db. CW, internal and external AM outputs are available. In addition, the 920A contains a DC-coupled varactor tuned frequency shift feature that permits narrow band FM and fine oscillator frequency control.

Model 923. Contains all the 920A features, and includes a 5-digit frequency readout display for increased resolution.

Model 910A. Similar to the 920A, but covers the frequency range from 100 kHz to 32 MHz with a calibrated RF output from 1 volt to 0.1 millivolt leveled to within ±1.0 dB. This high performance, low-cost generator is intended for limited range production use.



Model 950

A fully calibrated FM generator

The LogiMetrics Model 950 FM-AM Signal Generator covers the frequency range from 10 to 80 MHz and provides calibrated internal and external FM, AM, and CW outputs. A front panel modulation meter directly indicates the amount of FM deviation or % AM. Internal FM deviation is adjustable from 0 to 20 kHz peak, and once set, remains constant with frequency. Incidental FM and AM, and distortion are very low, increasing the generator's usefulness. The 950 RF output is calibrated and adjustable from 1 volt to 0.1 microvolt and leveled to within ±0.5 dB. The 950 frequency counter has a 3-digit "NIXIE" readout with an X100 expander switch to provide an effective 5-digit display with a resolution of 1 kHz.

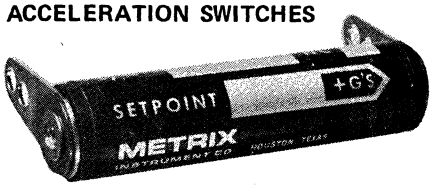
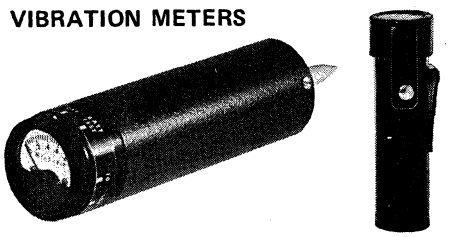
ACCELERATION SWITCHES



Model 5171 Acceleration Switch is factory set to close a set of electrical contacts when the unit is subjected to an acceleration greater than the setpoint. The unit is sensitive along the cylindrical axis in one direction only. The acceleration setpoint can be factory adjusted to any value from 2 G's to 100 G's, ±10%. Higher acceleration setpoints can be supplied but with less accuracy. Maximum acceleration is 1,000 G's. The switch contact rating is 28 VDC @ .5A. Both contacts are insulated from the plastic case, which is temperature rated from -40°C to +150°C. The case is hermetically sealed and measures .38" diam. x 1.7".

VIBRATION METERS



Model 5160 Vibration Meter is a self-contained probe, pickup and meter readout for on-the-spot measurements of vibration amplitudes. Vibration measurements are made simply by holding the probe end against the vibrating surface and observing the meter reading. Three full scale ranges of vibration displacement, velocity or acceleration are provided. The frequency range is 10 Hz to 1,000 Hz. When switched to the BATT position, the meter indicates the voltage of the 9 V transistor battery.

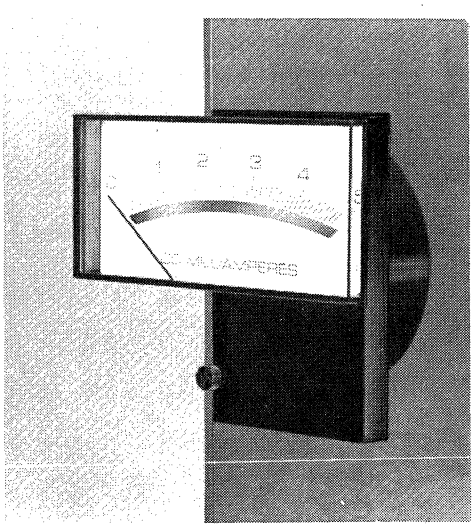
WINDO-MOUNT® METERS

W SERIES



If you want your panel to be the last word in sophisticated styling, specify Windo-Mount® meters! You see only the meter dial, through what appears to be a flush window in the instrument panel. Available in all standard Modutec sizes — concessions need be made to neither function nor appearance.

For illumination, see "Options" on next page. Mounting to panel can be done in several ways; for information request applications bulletin AB6-1 from your Modutec rep or from factory. Price: Same as "S" series, except see "Edge Options", below.

Edge Options

1. Clear. Concealed outside edge of dial cover is polished acrylic. This is the standard meter, and will be supplied unless specified otherwise.

2. White. Concealed outside edge of dial cover is painted opaque white.
To order: Add numeral "2" to the letter "W" in the catalog number, e.g., 4W2-AVU-190-AB, and add $0.75 to the list price.

3. Black. Concealed outside edge of dial cover is painted black.

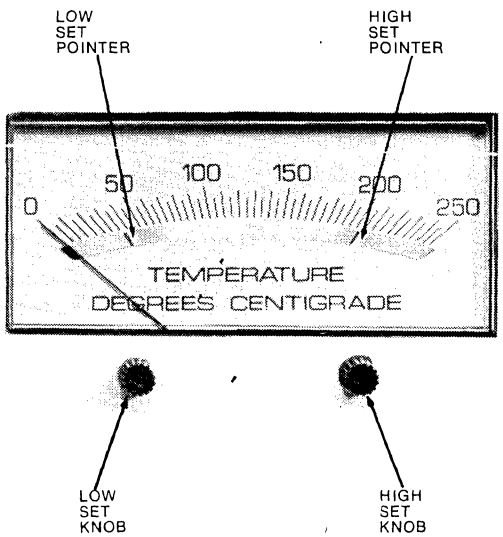
CONTROL METERS

A new approach to actuating and monitoring IC control circuits

The MODUTEC Control Meter combines a taut-band panel meter with precision potentiometers that are coupled to set point indicators. Both the panel meter and the potentiometer — set point indicator assemblies are accurately calibrated to the same meter dial (without mechanical interaction). The set point indicators move behind, rather than in front of the dial, and are visible through the mirror slot. This provides a desirable visual differentiation between indication and control, in addition to improving overall appearance.

Easily interfaced with readily available integrated circuit elements, the Modutec Control Meter offers the designer maximum flexibility in achieving accurate and reliable indication and control of almost any variable that must be continuously monitored, and at significant cost savings over alternate methods.

CATALOG — Phone or write for the special Control Meter Catalog, which gives full description, specifications, and applications data.



MODELS AND PRICES

Models — Modutec Control Meters are available in all four of the Modutec panel meter series described on these pages, in 3½", 4½", and 5½" sizes, and in all the ranges listed on the following pages, with the exception of Expanded Scale Meters, Null Meters, Elapsed Time Meters, and VU Meters.

All models are available in either single or dual set point versions.

Prices — To determine price of a Modutec Control Meter, first look up the price of the equivalent style, size and range panel meter, given on these and the following pages. The **additional** cost of a Control Meter is as follows:

Single set point version — $28.00
Dual set point version — $43.00

Discounts — Same as for regular panel meters, but applies only to the total number of control meters ordered.

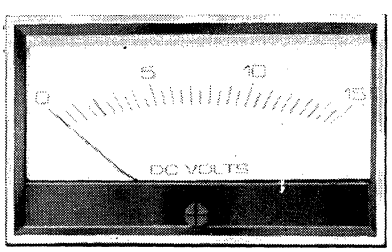
BEZEL MOUNT METERS

BA SERIES

Cast metal bezels are available for behind-panel mounting of S series or C series meters in all sizes. The cleanly designed bezel features minimum depth and cross-sectional area consistent with function, and is supplied in solid black finish or with brushed metal inline, as shown below.

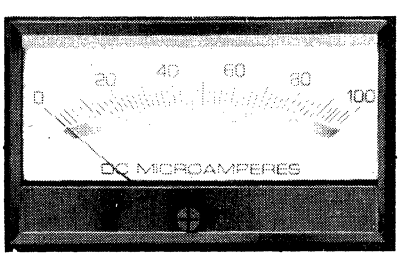
When you order a bezel mount meter you are, in effect, ordering a complete package, comprising meter, bezel, hardware, template, and mounting instructions. To order, substitute "BA" for the letter in the model designation, and add suffix "BA1", "BA2", "BA3", or "BA4". For example, 3BA-DVV-025-BA2 specifies a 3½" DC voltmeter, range 0-25 VDC, bezel mount with brushed metal inline over a clear cover meter.

Prices: Prices of bezel mount packages are obtained by adding to the basic meter prices (on the following page) as follows:
1½"—$2.20 2½"—$2.20 3½"—$2.20 4½"—$2.35 5½"—$2.50



BA1 brushed metal inline bezel, black cover meter.

BA2 brushed metal inline bezel, clear cover meter.



BA3 solid black bezel, black cover meter.

BA4 solid black bezel, clear cover meter.

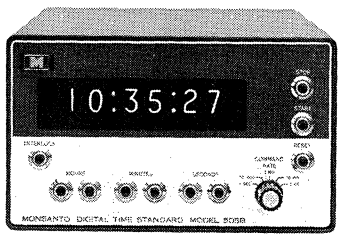
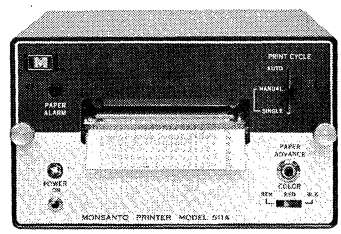
Frequency monitoring with a Monsanto digital counter is not just faster and easier than with analog instruments—it's instant and effortless. And more precise. Monsanto counters are FCC Type Approved for frequency monitoring. In addition, they can provide a full range of counter functions for other test and measurement jobs at the station.

Crystal controlled clocks and extensive use of ICs insure accuracy and long-term reliability. Automatic positioning of decimal point takes the element of human error out of measurements. Finally, Monsanto counters are modestly priced. For complete details, mail the coupon today. For a demonstration, call your local Monsanto representative.

What was your frequency at 10:35:27 last Tuesday?





Counter Models 101B, 105A and 114A provide BCD output. In combination with our 511A Printer and 505B Digital Clock, frequency and time are printed on paper tape at any desired interval, giving you a permanent record.

Never in the history of instrumentation has so much counter been packed into so little space for so few dollars.

Let's take those factors one at a time. Our new Model 150A is a 5Hz-32 MHz counter with solid-state 5-digit display. Automatic ranging and decimal point positioning are other features.

But the real news is that you can carry all this (and more) counter performance in the palm of your hand and activate it with either 12-32 VDC or 115/230 VAC. A battery pack will soon be available as an option if your work takes you beyond a convenient source of AC or DC.

Newsworthy, too, is the price of the Model 150A: Only $475. With our standard 2-year warranty too. Who but Monsanto could pack so much value into a space 2"H X 4½"W X 7½"D and weighing less than 3 lbs.?

Write or call for a data sheet on the Model 150A. The Monsanto representative has a Model 150A in his hand and would like to demonstrate it to you.

Most instruments offer a dual mode capability, permitting a single model to work with both resolvers and synchros. All units feature input/output isolation, and also direct in-line readout of angle, i.e., 359.999°, thus eliminating operator confusion, reading error and fatigue.

Series 530 — Resolver/Synchro Simulators

These simulators provide the ideal outputs for driving resolvers and synchros at 11.8, 26, 90 and 115V line-line voltages. These line-line voltages are all available with either 26V or 115V 400Hz excitation, and feature isolated input and output. Accuracy is 2 arc-seconds. Standard resolutions are .0001°, .001°, 1° and 5°, with standard units 3½" full-rack.

Their flat frequency vs. accuracy characteristic makes either unit an ideal choice for test facilities requiring maximum utility from all instruments. Both the Simulator and the Bridge provide selectable resolver and synchro modes for all standard line-line voltages in a 5¼" high full-rack unit. Angle is displayed as a non-ambiguous in-line readout from 0° to 360°.

Model 532 — Miniature Synchro Simulator

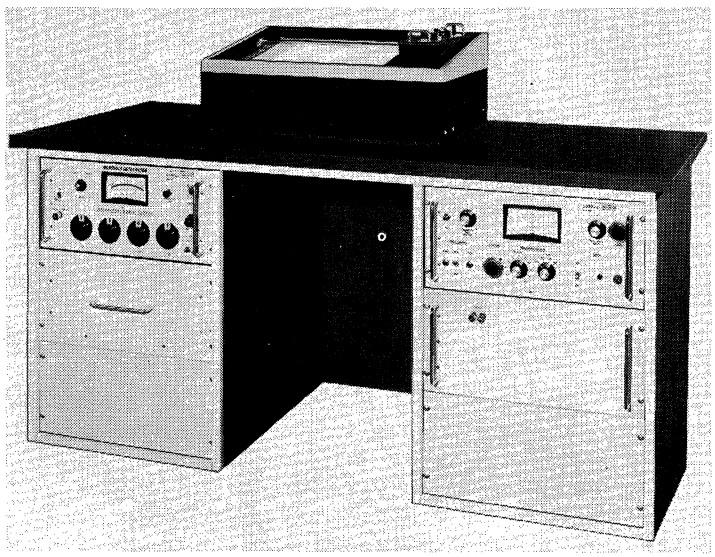
MODEL V ALL-ELECTRONIC D.C. HYSTERESIGRAPH

by Norman Industries, Inc.



The Model V Electronic DC Hysteresigraph replaces several laboratory pieces of equipment used in the point by point method of generating hysteresis curves. Traditionally the H axis is obtained by employing batteries, ammeter, rheostat, ballistic galvanometer and a reversing switch.

The operator is faced with the compound problem of monitoring power supply drift and balancing a ballistic galvanometer while reading flux and current.

The Model V DC Hysteresigraph does all this automatically by plotting a continuous B-H curve.

Operator time is decreased to approximately 20 seconds per curve and an infinite number of points plotted. No important data is overlooked or missed. Both major and minor loops may be programmed at will.

Driving samples to zero flux is insured by automatic recycle control so that initial permeability curves may be plotted.

The Hysteresigraph automatically does the following:

- Draws the positive half of the loop.
- Reverses the field when the preselected value of magnetization is reached.
- Draws the negative half of the loop and reverses direction of the field again when the desired value is reached.
- Initiates another reversal of field and completes the positive half of the loop.
- Lifts the pen from the recorder and turns off the current source.

Other programs are possible by manipulating front panel controls.

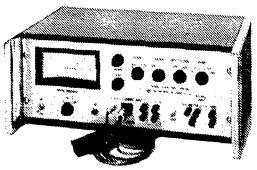
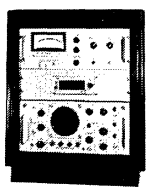
EQUIPMENT FOR CURRENT, POWER AND MAGNETIC FIELD MEASUREMENT

WIDEBAND WATTMETER



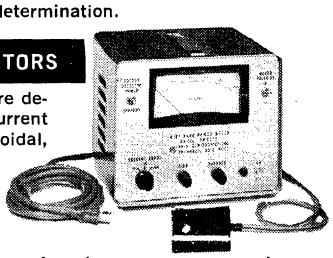
PM-4004 Wideband Pulse Power Monitors provide the unique ability to measure power in solid state switching circuits. The d.c. response and 30 nanosecond risetime insures accurate determination of instantaneous power waveform. Power input, power output, or power dissipated in solid-state devices may be readily determined. Built-in meters provide average or peak power reading. Instantaneous power, current, or voltage may be observed by connecting an oscilloscope to "monitor output" jack.

WIDEBAND POWER MONITORING EQUIPMENT



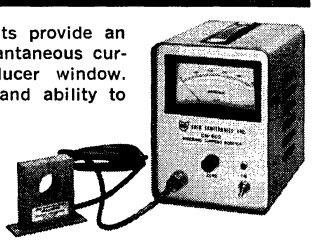
PM-6003 Power Monitoring Equipment is designed for power measurement in electrical discharge machining, resistance welding, and other applications where transient or non-sinusoidal waveforms are encountered at high current levels. D.c. to Megahertz response insures accurate measurement of power in processes where microsecond or less risetimes occur. Meter display of peak or average power is provided. Oscilloscope display of instantaneous voltage, current, or power waveforms with 100 nanosecond risetime, permits detailed analysis of system operation and efficiency determination.

WIDEBAND POWER MONITORS



PM-6010 Series Power Monitors are designed to provide power or current measurements where d.c., sinusoidal, non-sinusoidal or pulse power is delivered to a load. Currents up to 1000 Amperes can be handled with negligible circuit interaction due to the use of circuit isolated transducers. Meter display of peak or average power is provided. 0 to 1 volt output proportional to instantaneous power or current is available for oscilloscope monitoring of detailed waveforms with risetimes less than 1 microsecond in the d.c. to Megahertz frequency range.

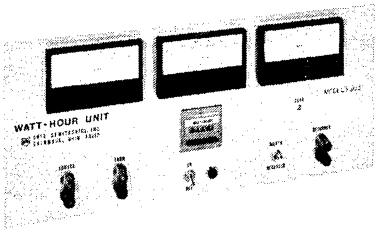
WIDEBAND d.c. to Megahertz CURRENT MEASURING EQUIPMENT



CM Series current measuring units provide an output signal proportional to instantaneous current flowing through the transducer window. The d.c. to Megahertz response and ability to faithfully reproduce 1 microsecond transients provide an ideal way to monitor critical circuits without electrical connection and with minimum interaction caused by measurement. The panel meter provides a display of direct current while the +1 to −1 volt output can be used for monitoring or control purposes with current flow in either direction.

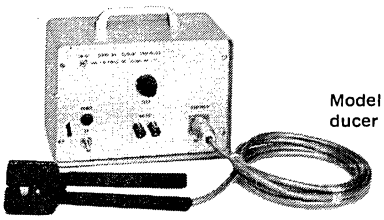
MODEL	PEAK CURRENT AMPERES	METER RANGE AMPERES	OUTPUT-VOLTS
CM-30	30	0 - 30	0 - 1
CM-100	100	0 - 100	0 - 1
CM-200	200	0 - 200	0 - 1
CM-600	600	0 - 500	0 - 1
CM-1000	1000	0 - 1000	0 - 1

WATT-HOUR METER



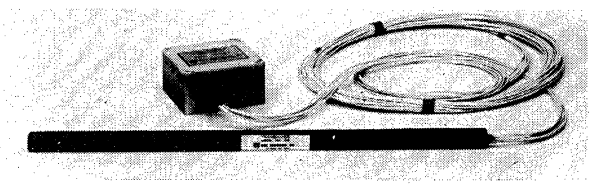
Model 2500 Watt-Hour Meters are designed to provide a registration of total energy consumption in d.c. circuits. Panel meters display instantaneous voltage, current, and power. Accumulated energy flow is registered on resettable counter up to 99,999 watt-hours.

CLAMP-ON CURRENT TRANSDUCER



Model CM-50F Current Transducer provides measurement of current without interrupting circuit. Accuracy better than 0.25%, measurements to 50 Amperes and d.c. to Kilohertz response are featured. D.c. or a.c. voltmeter may be connected to output terminals for monitoring of the 0.1 volt/Ampere output which is directly proportional to the instantaneous current flow through the window.

MAGNETIC DISPLACEMENT AND PROXIMITY MONITOR MODEL MS-1100/MA-1100



MS-1100/MA-1100 Magnetic Displacement and Proximity monitors provide non-contacting measurement of displacement over a 20 inch range. The amplifier-power supply unit (MA-1100) can be remotely located and provides a 0-5 volt output for telemetry or control applications.

BROADBAND R.F.I. AND E.M.C. MAGNETIC ANTENNAS AND MAGNETOMETERS

O.S.I. has designed the MS-1000 magnetic antenna for application in interference reduction, testing and measurement of magnetic fields in the d.c. to Megahertz range. Sensitivities of 100 millivolts per gauss, unamplified, from the basic antenna with output independent of frequency, illustrates performance. Vector Magnetometer units, providing an output of 10 volts in the earth's field, can be provided for particular applicational requirements.

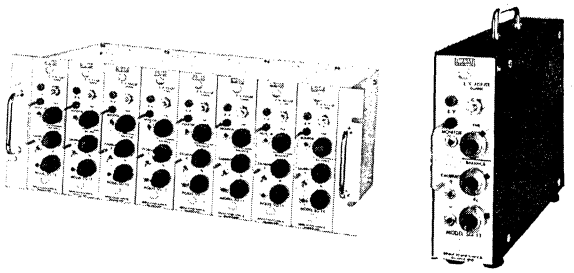
SIGNAL CONDITIONERS



The SG-11 is a plug-in module consisting of a power supply and the balance, calibration and monitoring circuits for strain gage and similar transducers. The power supply circuit exhibits very high temperature and time stability and provides line and load regulation of 0.01%; excitation voltage is continuously adjustable from 0 to 16 volts at 0 to 150 mA. The all-silicon transistor circuitry features a self-restoring current limit circuit. These units can be wired for constant-current operation.

Extreme care has been taken to provide very high isolation to line--less than 0.03 pF coupling capacitance from power line to D.C. output--so that the instrument's performance approximates that of battery operation.

The BALANCE, CALIBRATION, and E. V. COARSE and FINE adjust controls are on the panel for easy adjustment and are all ten-turn potentiometers of very high resolution. Calibration is bipolar single shunt.

Two types of enclosures are available: a relay-rack mounting enclosure that permits the mounting of eight units side-by-side in a 19-inch rack and a portable enclosure, accepting a single plug-in unit. A plug-in power supply, only, is also available.

The NR high-frequency spectrum analyzers provide unequalled capability for rapid broadband scanning, as well as highly resolved, narrow-band analysis; at lowest cost.

The narrow-band analyzers are well suited for signal analysis of SSB, AM, FM, and data communications. They have such essential features as 60 db dynamic range for distortion measurements, 60 db log amplitude scale, simplified operation and automatically optimized resolution. Some models include self-checking crystal controlled frequency markers.

The all solid-state wideband analyzers provide dispersions up to 1 GHz stable narrow scans, usable 60 db display range, high and uniform sensitivity, and automatically optimized resolution. In some models, highly stable phase locked narrow band scans are provided.

Typically, these analyzers are employed for pulsed and CW signal analysis, telemetry and multiplexed carrier monitoring, frequency response studies, spectrum signature and surveillance; harmonic and spurious analysis.

HIGH FREQUENCY ACCURACY—Frequency indication is accurate to ±0.5%.

DIGITAL FREQUENCY READOUT — Frequency setting is displayed on an easy-to-read digital indicator; turned by the UNIDIAL ® one-knob tuning contol.

HIGH POWER OUTPUT — Signal sources provide up to 50 mw; signal generators up to 15 mw. Doublers range from 0 to —100 dbm calibrated.

HIGH ATTENUATOR ACCURACY — Fully calibrated attenuator to —127 dbm over full frequency range.

STABILITY — Frequency and power-stability are representative of the highest state of the art.

FULL MODULATION CAPABILITY — Polarad's modular line offers maximum versatility for all test applications through a wide range of internal and external pulse, square wave and FM modulation.

PHASE LOCK — A frequency stabilizer module permits locking of frequency to crystal stability. Phase lock capability is built into all Polarad modular signal instruments.

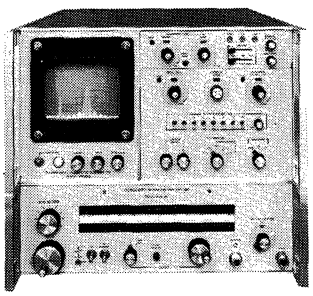
MICROWAVE SPECTRUM ANALYZERS 10 MHz-90 GHz



The Model SA 2650 Microwave Spectrum Analyzer employs new design concepts which provide increased performance and reliability. This Broadband Spectrum Analyzer utilizes both RF and IF sweep techniques to provide narrowband stability and resolution with wide image free frequency spans. A solid state swept first local oscillator is employed for wide dispersions up to 2 GHz. For frequency spans of 3 MHz or less, a stabilized cavity first LO with very low residual FM provides repeatable displays for stable high resolution measurements. The unique design enables the user to obtain spurious free displays through X-Band without the use of costly preselectors or filters. Frequency tuning, dispersion, IF Bandwidth, sweep speeds and CRT scales are all directly calibrated. RF and IF frequency markers self check the frequency and dispersion calibrations for more accurate measurements. The CRT Log presentation is calibrated over a full 70 db dynamic range. Other convenience features: automatic optimized and adjustable resolution, simplified foolproof signal identification.

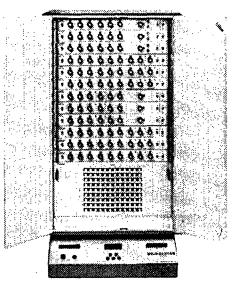
Model 7000



Automatic Semiconductor Test System

The Model 7000 is an inexpensive system with many uses: small production-run testing; incoming inspection; pre-assembly classification and matching of semiconductor devices.

Performs all DC tests for a broad range of low-and-medium-powered transistor types, plus breakdown, leakage, and forward conduction testing of all types of diodes.

Testing may be either Go/No-Go, or devices may be classified into 10 bin categories. Test rates of up to 2000 devices per hour can be achieved by even unskilled operators.

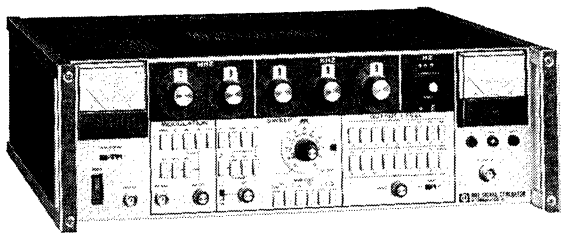
80 MHz SYNTHESIZED GENERATOR/SWEEPER



MODEL RF-808

$3576

- 50 KHz to 80 MHz
- Stability 5 PP 10^9/Day
- 0.1 μV to 10V into 50 ohms
- AM, FM, or Pulse Modulation
- Manual and Automatic Sweep
- Fully Programmable
- Low Spurious and Harmonics
- All Solid State

The RF-808 Signal Generator is a synthesizer and sweeper in addition to a standard signal generator covering .05 to 80 mhz in 1 khz steps with a vernier settable to 1 hz. The unit features remote programmability, digital frequency setting, high signal power output, FM, AM, pulse, automatic sweep, and manual sweep.

The RF-808 has digital synthesizer performance, yet retains the manual and vernier tuning and low spurious output of conventional signal generators. Applications include automated test systems where frequency, amplitude, and modulation must be computer controlled; general purpose lab use where high stability, digital or analog tuning, sweep, and modulation versatility are needed; receiver and communication system testing from ultrasonic up into VHF ranges. The unit is intended for bench use, but a standard rack panel adapter is available using only 5¼ inches of rack space.

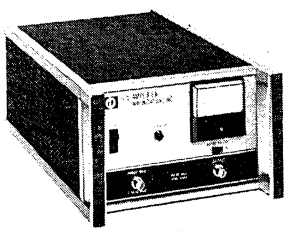
80 MHz WIDEBAND RF POWER AMPLIFIER

The RF-805 is a solid state amplifier, broadband from .05 to 80 mhz, producing ten watts with —30 db harmonic and intermodulation distortion, lower distortion at lower output levels. Gain is 47 db minimum, constant within 1 db. Full output is developed with less than 0.1 volt at the 50 ohm input. Accurate output metering and overload protection is provided.

The RF-805 will raise the power of most manual and swept tuned signal generators extending their versatility. Receiver testing, wattmeter calibration, antenna testing, RFI testing, attenuator measurements, and filter and component testing will be aided with this equipment. Optional rack mounting uses 5¼" rack height.

MODEL RF-805

- 10 Watts Output into 50Ω
- 0.1 Volts In—22.5 Volts Out
- .05 MHz to 80 MHz Broadband
- Flat 47 db Gain
- Solid State
- Low Distortion

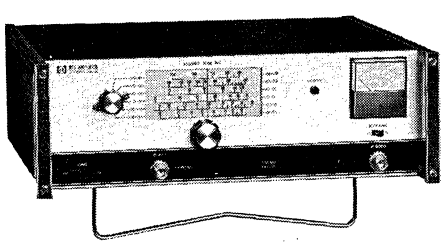


$1176

10-500 MHz TUNABLE RF POWER AMPLIFIER

Tunable in six bandswitched ranges from 10 to 500 MHz, the RF-815 provides up to 8 watts of RF power into a 50 ohm load. With about 40 db of gain, the 3 db RF bandwidth is 1.0 MHz at the low end of the frequency range, increasing to 5 MHz wide at 500 MHz. Accurate output metering and overload protection is provided.

Applications include amplification of signal generator outputs up to 20 volts, selective amplification of RF signals as provided by a receiver preselector, exciter driver stage for transmitters, RFI testing, attenuator measurements, harmonic amplification, and many others. All solid state except for the one tube output stage. Simple mechanical design provides for easy maintenance. Light weight of 25 pounds makes the unit portable for bench use. Optional rack mounting uses 5¼" rack height.



$1150

MODEL RF-815

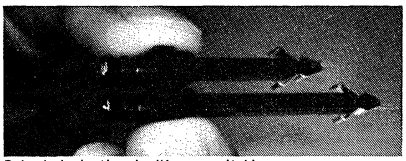
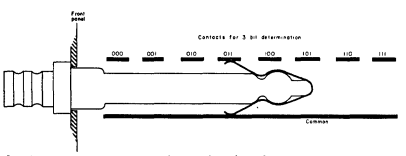
DIGITAL DATA WORD GENERATORS

These ultra compact instruments provide the same capability as toggle switch generators in a fraction of the space. For example, the compact Model 912 provides 960 binary bits (equal to 960 toggle switches) in 3″x8″ panel space. The entire line of programmable digital data generators can simulate the digital input or output of computers or computer peripheral equipment. They can also be used to operate and control production test equipment and other externally controllable test devices.



Patented plastic pin (linear switch) is equivalent to 3 toggle switches.

The key to SRC Digital Data Word Generator capabilities is the unique plastic pin (linear switch). The pins are available in eight discrete lengths, each equaling an octal increment (0 thru 7) which is capable of programming 3 binary bits.



Contact arrangement when plastic pin (linear switch) is inserted.

For example, to program 12 binary bits (110, 101, 010, 011) simply convert to decimal equivalents (6, 5, 2 & 3 respectively) and insert the octal pins numbered 6, 5, 2 & 3.

Word/bit length depends on model. For example, the Model 912 can program:

30 words of up to 32 bits
48 words of up to 20 bits
60 words of up to 16 bits

and an almost infinite number of other combinations.

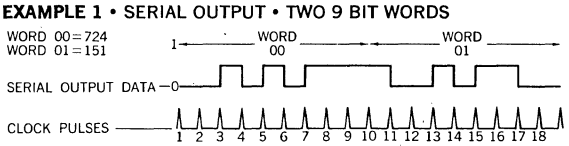
EXAMPLE OF PROGRAMMING

EXAMPLE 1 • SERIAL OUTPUT • TWO 9 BIT WORDS

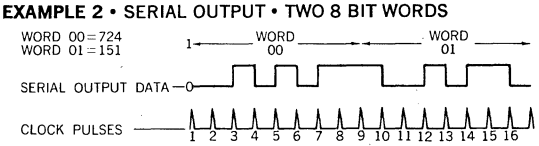


EXAMPLE: 8 BIT WORD

If the bit/word was set to 8, the most significant bit in each word would be omitted.

1st word = 724 = 11 010 100
2nd word = 151 = 01 101 001

EXAMPLE 2 • SERIAL OUTPUT • TWO 8 BIT WORDS



The output NRZ pulse train would appear as follows: The same format holds true for even shorter word lengths. A 7 bit word would eliminate the TWO most significant bits from each octal word, while a 6 bit word would mean the THREE most significant bits were omitted.

EXAMPLE 3 • PARALLEL OUTPUT • THREE 9 BIT WORDS

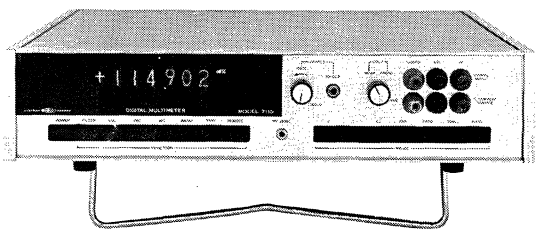
The 6150 series expandable universal counter-timers consists of four basic models covering frequency ranges of 50, 200, 512 MHz, and fully automatic 3 GHz. The frequency range of the basic 50 MHz unit is expanded simply by inserting a new PC card. BCD outputs, extra readout digits, and many other features also may be added by use of PC cards. S-D's 6050 series are low cost, half-rack width frequency measuring instruments available in four basic ranges to 3 GHz using the same expandability concept. Other S-D counters range from simple 12.4 MHz frequency meters to fully automatic microwave counters to 40 GHz with time base stability as high as 5 parts in 10^{10} per 24 hours.



Digital voltmeters and multimeters. The full line ranges from a simple 3-digit DC voltmeter priced at $319 to .005% five and one-half digit multimeters that measure voltage (AC and DC), current (AC and DC), and resistance. The precision integrating meters feature 1 μv resolution, 120 dB noise rejection, selectable input filtering, and reading speeds up to 30 per second. Models 7000A, 7005, and 7110 are completely expandable.

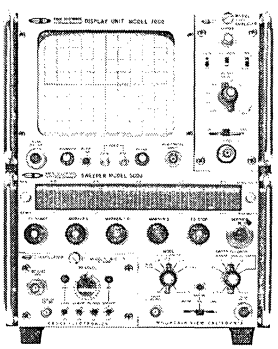
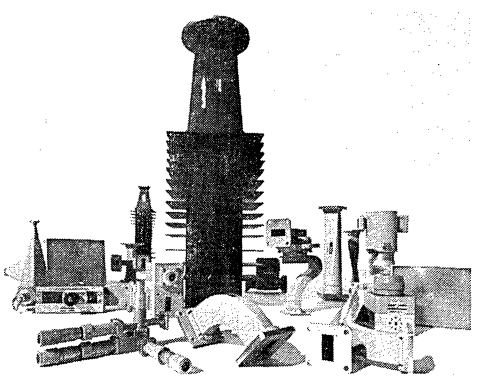
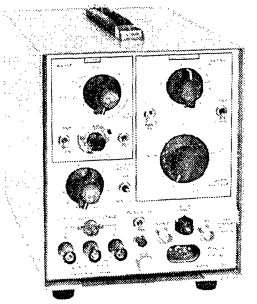
Model 751 (shown) has a 500 MHz scan width, 1 kHz IF resolution and selectable RF attenuation in 10 dB steps. Adding a converter module boosts the operation of the 751 to 40 GHz. Ideal for radar pulse analysis, EMI measurements, communications evaluation and microwave component testing.



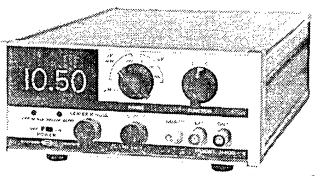
Sweepers. Kruse Model 5000A (shown) operates from 10 MHz to 18 GHz with wide range plug-ins. Extremely compact and versatile. Ideal for testing power gain, insertion loss, and frequency response characteristics of communications systems. Basic sweeper expands easily. Available are multiband power units, multiplexers, and controllers. You get direct readout of data on a compact X-Y CRT Display Unit, Model 7000.



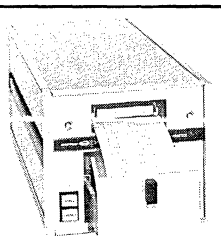
Microwave Components. Over 3,000 components are available in waveguide, coax, AIR-STRIP® and solid state —spanning frequency ranges from 1 GHz to 140 GHz.



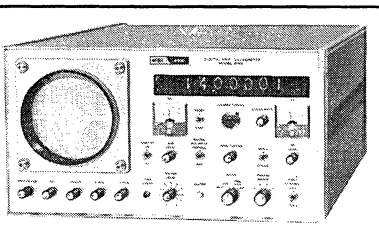
Curve Tracers. Two models priced at $750 and $1,760. S-D's self-powered 9550 tracer plugs into any X-Y scope. It draws 8 curves and offers all basic functions for full-range testing of two and three-terminal devices. Use it as a bench unit or as a plug-in to Tektronix 530, 540, and 550 series scopes.



Digital L-C Meter. The automatic digital readout of S-D's unique L-C meter saves hours of measuring time. Priced at $550, the instrument rapidly pays for itself. Model 9400 measures inductance from 0.1 μH to 100 mH and capacitance from 0.1 pF to 100 μF with an accuracy of ±1%.



Digital Printers. The basic Model 5103 is a 5-column, asynchronous, 3-line/sec printer. It expands to a 21-column printer with 16 characters/column simply by adding economical 5-column plug-in boards. Any 4-line BCD code can be handled with a single IC socket change. Many other features, such as dual source operation, are standard. Price of basic 5103: $945.



Gaussmeters, Magnets and Digital Voltage Calibrators. Alpha Scientific, a subsidiary of Systron-Donner Corporation, manufactures a complete line of NMR and Hall Effect gaussmeters, precision electromagnets for every application, magnetic susceptibility systems, and a broad range of 1 kilowatt to 3 megawatt power supplies. The Alpha M106 Precision Digital Voltage Source is a unique 0-1,000 VDC digital calibrator with 0.003% accuracy, 0.001% stability.

FET V-O-M with AUTO-POLARITY

MODEL 602

1. **FET V-O-M with Auto-Polarity—convenient and time saving.**
2. **Low voltage range of 300 mV; 10 megohm AC input impedance and 11 megohm DC input resistance.**
3. **Simplified scale—only 4 arcs for all 38 ranges.**

Designed to speed testing by reading upscale regardless of circuit polarity, yet handy push-buttons allow selection and determination of polarity when required. 0.3 V full scale in lowest range on both AC and DC. Tester offers 38 ranges, but 24 AC/DC ranges are read from only two arcs on 4½" meter to keep dial clean and readable. Input amplifier incorporates a high degree of feedback so both AC and DC meter tracking scales are linear. In Auto-Polarity mode, instrument is not adjusted for zero, but for zero or lowest null. This means zero adjustment can be made from virtually any angle without introducing a parallax error. 50 μA suspension-type meter movement absorbs shocks and jars that would disable ordinary meters. Accuracy: ±3% on all Voltage ranges except 1000V ±4%; ±4% on all current ranges; ±3% of DCV arc on resistance. AC ranges for frequencies from 50 Hz to 50 KHz.

Panel Meters for Every Purpose

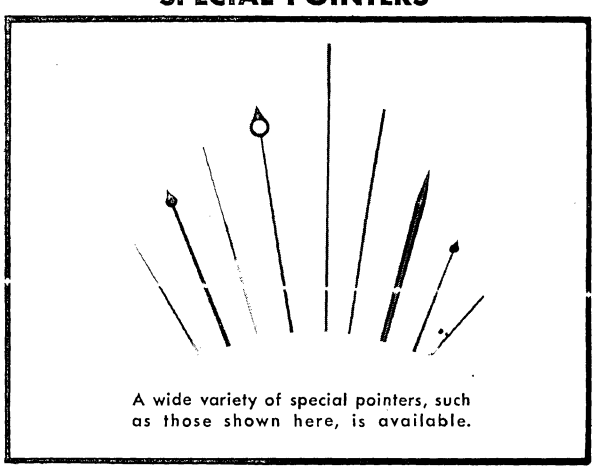
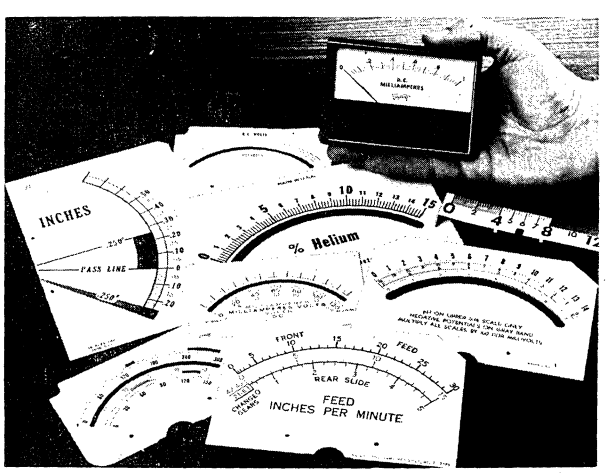
Often a standard panel meter, such as the many thousands listed in this catalog, will not suit a particular application. Sometimes special resistances, scales, cases or other special features are desired. The Triplett Corporation offers over 65 years of meter "know-how" in these areas. We are prepared to offer the engineering assistance needed to solve your special requirements problem. Contact the factory or your representative for your special requirements.

SPECIAL POINTERS



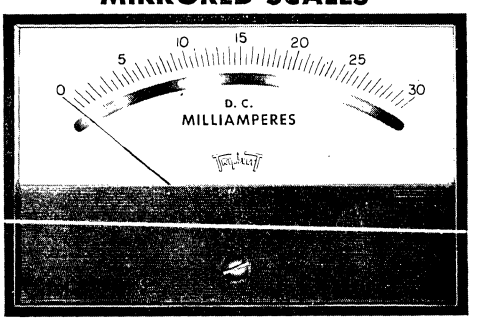
A wide variety of special pointers, such as those shown here, is available.

SPECIAL SCALE READINGS



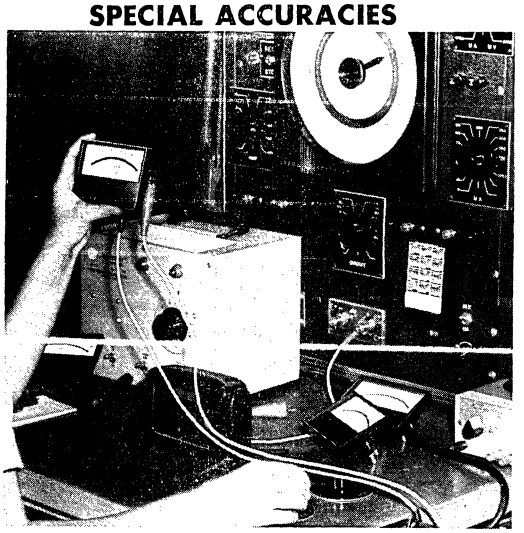
A panel meter can be used to indicate much more than just volts or amperes. Do you need to read pH, Roentgens, smoke density, or inches per minute? These are a few of the uses to which a panel meter may be applied.

MIRRORED SCALES

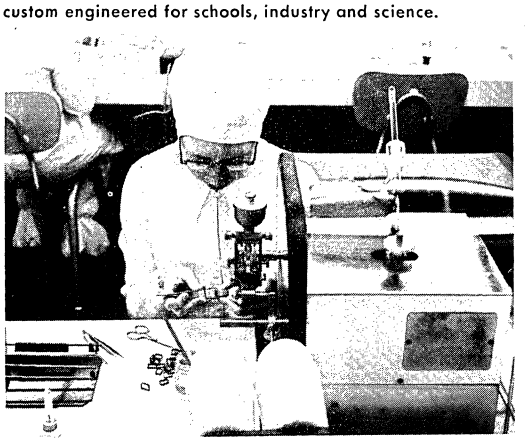


Mirrored scales for use on meters with increased accuracies over the standard ± 2% are frequently required.

SPECIAL ACCURACIES



Our facilities are capable of supplying special ranges, accuracies, and instrument dynamics. Special pointer designs, dials, terminals, and case configurations have been custom engineered for schools, industry and science.



Triplett has been, and remains, a leader in technological advances in the instrument industry.
We invite you to contact us when your requirements dictate extra quality, performance, and function.

Nickel-Cadmium and Silver-Zinc Battery Charger/Analyzer Systems

W R E

MODEL 1575 *Nickel-Cadmium System*

This battery charger-analyzer concept is thoroughly design tested as a system to provide maximum efficiency in programmed maintenance of nickel-cadmium batteries.

Required sequence of events is unitized in a functional package to increase work flow efficiency with minimum equipment. Since all units can function simultaneously, single system has capacity for 3 batteries at a time; i.e., one discharging, one charging, and one under evaluation.

Exhaustive tests have proven this system to assure a full charge — safely! . . . and provide cell restandardization in the process.

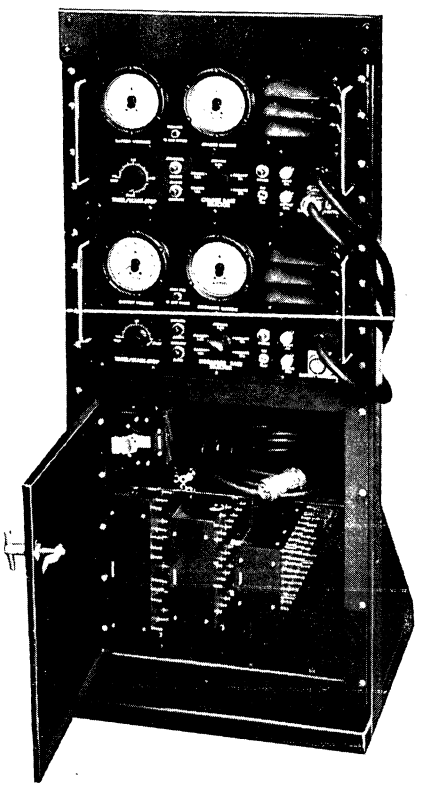
1) Deep discharge of each cell assures total emptying of battery safely — with all cells to "zero". This standardizing effect assures a zero-base for each cell.
2) 150% ampere-hour charge at precise prescribed rate assures "total-fill" of the battery.
3) Evaluation cycle "pulls" 100% of battery rated capacity in 2 hours. Analyzer automatically cuts off at either of 2 points . . . at preset voltage point, or at 2 hours . . . and "holds" the result.

ANALYZER, MODEL 1000 — Discharge Rate: 5 preselectable discharge current ranges: 1.8, 2.5, 5.5, 11, 17 amperes. Discharge Time: 0-2 hours, ±5%. Cut-off Voltage: Internally adjustable, 17-20 volts. Indicators: "Capacity Accept", "Capacity Reject", "Power On". Meters: 250°, 4½", ruggedized. Voltmeter: 0-40 volts. Ammeter: 2-range; 0-10, 0-20 amperes. Circuit: Solid state power switching. Physical: 19" W., 10½" H., 11" D., 33 lbs. Rugged, portable, rack mountable, drip-proof construction. Cooling is forced air.

CHARGER, MODEL 1500 — Charge Current: 5 preselectable ranges: 1.8, 2.5, 5.5, 11, 17 amperes, ±3%. Charge Time: 0-3 hours ±5%. Meters: 250°, 4½", ruggedized. Voltmeter: 0-40 volts. Ammeter: 2-range; 0-10, 0-20 amperes, Overload Protection: Charge terminates if output voltage rises above 33V on all ranges (except 2.5A range — 34.5V). Indicators: "Power On", "Charge Complete", "Abnormal Charge". Circuit: Solid state. Physical: 19" W., 10½" H., 11" D., 72 lbs. Rugged, portable, rack mountable, drip-proof. Cooling is forced air.

5 popular discharge fixtures for fixed resistive load to each cell at the C/2 rate, and MA and MS type battery cables are available from stock. Other fixtures are available on special order.

Specifications subject to change without notice.



Overall system, rack and cabinet, is approximately 22" W., 4' H., 12" D., 192 lbs. and is of strong steel construction with drip-proof finish. Discharge fixtures and cables fit neatly into the compartmentized storage cabinet.

MODEL 1525 *Silver-Zinc Battery Charger*

Also charges Nickel-Cadmium, Silver-Cadmium, and Lead-Acid Types

The Model 1525 is a portable, 3-channel battery charger that meets the most stringent requirements for charging Silver-Zinc batteries (such as BB-451/U types).

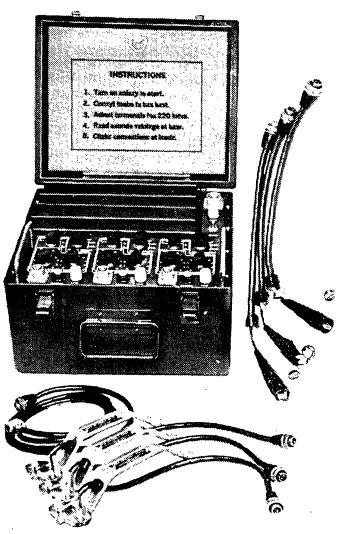
The unit is designed with modular plug-in circuits and features a precision, solid state electronic control that permits front-panel programming of cut-off voltages in one-tenth volt steps, from 0.0 to 36.0 volts. This programming extends the capabilities so that the equipment may be used for charging Silver-Cadmium, Nickel-Cadmium or Lead-Acid battery types.

Each of the 3 channels may be used independently at currents of 1.0 or 2.25 amperes, or connected in parallel to provide up to nine different currents (up to 6.75 amperes).

Fail-safe charging indication is provided via internal sensing circuitry which assures that the programmed charging current is flowing when the charging lamp is lighted. The system automatically prevents damage to batteries or charger due to operator error.

Single cell charge capability permits charge equalizing of a battery. The 1525 is thoroughly militarized . . . including R.F.I. suppression.

Accessories furnished include 3 special charging handles for BB-451/U Silver-Zincs, and universal charging cables for other batteries. Cables, line cord and instruction manual are neatly stored in the case lid. Self-contained, water tight portable case; 13⅝" W., 11" H., 11½" D., 38 pounds net.



Specifications subject to change without notice.

∿, ⊓, ⋀.
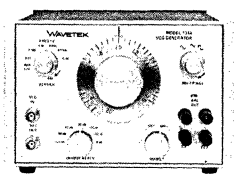
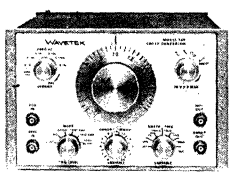
$395



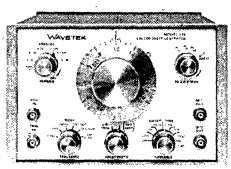
The Model 131A is a precision source of voltage controlled signals. The frequency may be dc programmed or modulated with a wideband ac signal. The frequency can be swept over a 1000:1 ratio covering the audio range of 20 Hz to 20 kHz in a single sweep. The output impedance is selectable with 50Ω or 600Ω balanced output. A 60 dB step attenuator gives precision control over output signal level for increased versatility.

Model 134
Sweep/Trigger VCG
0.2 Hz to 2 MHz
∿, ⊓, ⋀, ◿.
$495



The Model 134 combines (1) a precision VCG having sine, square and triangle waveform outputs, and (2) an independent triggered ramp or sawtooth generator supplying the voltage to sweep the frequency of the first. This unit is virtually a portable oscillator, square wave generator, frequency shift keyer, and a sweep and tone burst generator in one compact package.

Model 135
Lin/Log
Sweep Generator
0.2 Hz to 2 MHz
∿, ⊓, ⋀, ◿.
$695



The Model 135 Sweep Generator is an extension of the Model 134 described above. The 157/170 Series allows frequency, function and amplitude to be controlled locally with front-panel switching or remotely by BCD programming. A trigger capability allows a single cycle of any waveform (or a burst of cycles) when gated from an external source. VCO sweep and gated tone burst can be automatically programmed from digital or analog sources.

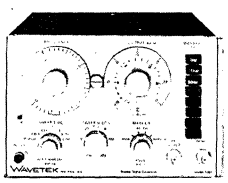
Model 154 Programmable DC/Signal Generator
0.001 Hz to 10 MHz
∿, ⊓, ⋀, ◇◇.
$1995

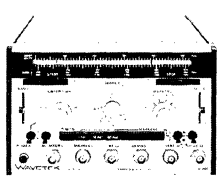
The Model 154 Programmable Generator provides sine, square and triangle waveforms from 0.001 Hz to 10 MHz. In addition to the waveforms, dc voltage output to ±10 volts may be selected. The instrument may be controlled by front panel controls or remote logic level digital programming of all functions. To add to the versatility of the unique instrument, the frequency and amplitude may be modulated by an external analog signal.

Models 1001-1005 Sweep/Signal Generator
0.5 MHz to 1.4 GHz
$995/$1095



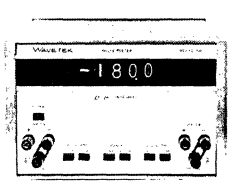
The 1000 Series Sweep Generators are wideband general purpose instruments offering selected frequency bands and multi-function capabilities. The five instruments and their frequency ranges are 1001 — 0.5 to 300 MHz; 1002 — 1.0 to 500 MHz; 1003 — 350 to 650 MHz; 1004 — 500 to 1000 MHz; 1005 — 700 to 1400 MHz. The output signal is controllable over a 77 dB range and sweep width can be adjusted from 200 kHz to the full band of the instrument.

Model 2001 Sweep/Signal Generator
0.5 MHz to 1.4 GHz
$1695



The Model 2001 is a three band Sweep Generator with exceptional versatility in a rugged inexpensive instrument. The easy-to-use controls allow precise selection of operational mode (Start-Stop, Δf, or CW) and of frequency limits. Sweep width can be up to 500 MHz. Output level is controllable over a 90 dB range, from +10 dBm to −80 dBm. The unique capabilities of the 2001 are equally suited to laboratory or production applications.

Models 740/750 Phase Meters
10 Hz to 2 MHz
$895/$1495



The Models 740 and 750 Phase Meters will accurately measure the phase angle between any two ac signals having an amplitude ratio as great as 1,000:1 within the 10 Hz to 2 MHz range. Automatic operation eliminates the need for amplitude matching, frequency tuning and output filtering, resulting in true hands-off operation. The Model 740 has an analog readout; the Model 750 has a 4-digit (0.1°) readout.

Model 755 Programmable Phase Meter
40 Hz to 2 MHz
$1995

The Model 755 is an automatic digital phase meter intended for phase measurement in systems applications. It features automatic/programmable operation and permits measurement over a 1,000:1 range of input signals. The Model 755 may be programmed to update a phase angle reading upon receipt of a read command from an external source. All automatic controls may be operated manually from rear panel for added convenience.

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem**, the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

PLOTAMATIC X-Y RECORDERS

SERIES 700 LOW-COST 8½" × 11" RECORDERS WITH PAD/LOAD®

The Series 700 recorders, while low in cost, still meet or exceed the performance specifications of many higher-priced recorders.

The new "PAD/LOAD"® paper feed system operates three times faster than those available on conventional single sheet machines. A 50-sheet pad of paper is loaded into the recorder, and as each page is consumed, the operator simply tears off the used sheet, exposing a new sheet.

All Series 700 PLOTAMATICS have • I/C circuitry • no mechanical or photo choppers • clean fibre-tip pens • electronic overdrive protection • operate from 50–400 Hz power • buffered feedback potentiometers for noise immunity ± 0.2% F.S. accuracy • 17 in./sec, slew speed • differential guarded inputs with 140 dB CMR • no servo gain adjustments.

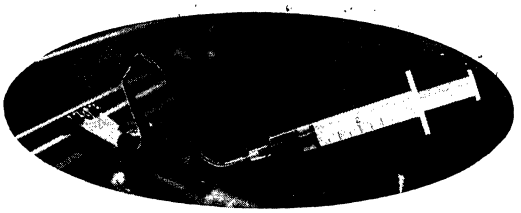
"Drop-In" Chart-Loading

Unique with the Dohrmann Recorder is the drop-in chart-loading system. The chart is dropped into the cradles which support the ends of the chart roll, then pulled across the forward "free-running" clutch-actuated drive sprockets . . . no tedious threading of chart paper is involved. Modern paper edge guides maintain the chart paper in a flat plane on the stainless steel writing table of the recorder with no obstruction of the recording.



Fast "Long-Term" Inking — No Ink Spillage

A special capillary pen system has been developed by Dohrmann to provide: (A) continuous writing at high speed; (B) no ink spillage when pen is driven off scale (against end stops); (C) large ink reservoir capacity; (D) easy ink-loading system. Using the ink syringe supplied with the recorder makes rapid, clean ink-loading possible and eliminates the "inverse meniscus" problem associated with wire pen cleaners. The pen can be primed easily by the hydraulic action of the syringe. Gone forever is the ink "mess" associated with loading the recorder pen.

S-Y®

RECORDING FOR MULTI-CHANNEL ANALYZER APPLICATION

S-Y recording performs the plotting functions of an X-Y BETTER. The stepwise chart advance is synchronized with the memory scan, providing independent channel readout.

FEATURES

- **Out-performs X-Y Plotters**
- **Interlocks with All Multichannel Analyzers**
- **No Chart Length Limitation**
- **Completely Eliminates X-axis Point Plotting**

DESCRIPTION

The operational sequence of the S-Y is as follows:

As the analyzer advances to a new channel, the recorder pen traces the signal level for that channel while simultaneously inhibiting the chart advance. When the pen ceases to move, the chart drive circuit receives an advance signal from the analyzer and moves the paper **one** STEP, providing a plateau level for that particular channel.

The analyzer then proceeds to the next channel, repeating the procedure. The resulting histogram plot is very easy to interpret. The staircase plot eliminates searching for individual channels and tedious point plotting.

PULSE GENERATORS

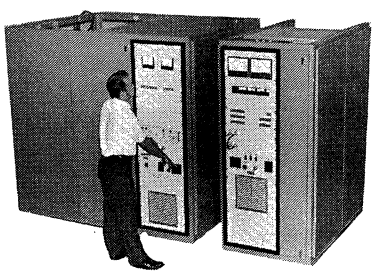
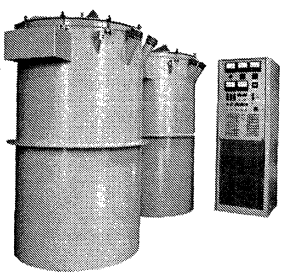
Cober's line of pulse generators is characterized by their pulse fidelity and flexibility. They are all at high power with rise times measured in nanoseconds, rep rates from single shot up to 1MHz, and pulse widths going to D.C. Some models contain built-in regulated bias supplies and high voltage isolation to allow convenient use as a microwave tube grid pulser.



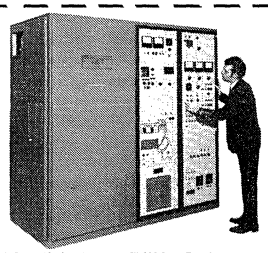
Model 1625 Series Modulator has output of 25KV at 10 amperes. Operates at pulse durations of up to 4 seconds at 50% duty cycle. Drives particle accelerator R.F. Amplifiers.



Model 1674 Klystron Modulator generates 150KV pulses at 110 amperes. Includes Cober ST-77 electronic crowbar for fast-acting protection for klystron. Used in advanced radar systems.

PULSE MODULATORS

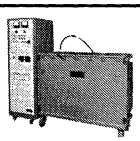
Cober's line of pulse modulators includes units to drive every high power pulsed microwave tube. Power levels range from a few kilowatts to over 100 megawatts. In addition to standard modulators, we specialize in the generation of state-of-the-art nanosecond rise times and high rep rates with short pulses to long pulses of thousands of microseconds. Full MIL-SPEC, solid state modulators are supplied for systems use, and soft tube and hard tube units are furnished for laboratories and particle accelerator facilities.



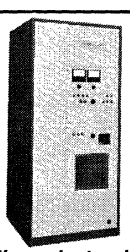
Model 1643 High Power T.W.T. Test Set permits operation of T.W.T.'s in CW, Grid Pulse, Cathode Pulse and Mod-anode pulse modes.

MICROWAVE TUBE TEST EQUIPMENT

Cober is recognized as the leading supplier of high power microwave tube test facilities. Included are highly regulated power supplies, modulators, T.U.T. chambers and protective circuitry for load, personnel and equipment. Models are manufactured to age and test T.W.T.'s, B.W.O.'s, CFA's, magnetrons as well as triodes and tetrodes.



Model BF-100-320 is rated at 100KV, 320Ma. Unit is all solid state, has reversible polarity and is frequently used to drive high power lasers.



Model 1631 has output of 12KV at 1 ampere. It is electronically regulated to reduce ripple and noise to 10 millivolts.

DC POWER SUPPLIES

Laboratory and MIL-SPEC DC Supplies over 5Kw and at voltages between 5KV and 1,000KV are manufactured. Standard Cober electromechanical or electronic regulator modules can be incorporated in our laboratory supplies to furnish regulation and ripple to 0.001%. Our systems engineering group designs full MIL-SPEC units and provides all integration and software to satisfy government requirements.

COBER PRODUCT CONCEPT

The products shown on these pages are representative of Cober's very broad line. They have, in common, a concept of standard packaged modules and designs which make it as easy and as economical for our customers to buy units to their own specifications as it is for them to buy our standard units. If your problem is in the area of high power electronics, won't you please send it to me!

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem**, the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

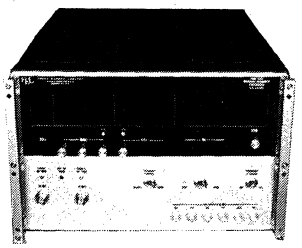
Ultimate satellite terminal L.O.



FEL 700B Microwave Synthesizer

ULTRA-LOW PHASE NOISE

The 700B exceeds the most stringent satellite communications system noise requirements — from L through X band. Output signals can be internally down-converted to provide frequencies from DC through UHF with excellent phase noise and spurious performance.

COMPACT "ONE BOX" L.O. SYSTEM

Minimize your system costs and risks by specifying the 700B Microwave Synthesizer. The 700B does not require the frequency multiplication or up-conversion normally required when using HF or VHF frequency synthesizers. Compact size allows many 700B L.O.'s to be stacked in one standard rack.

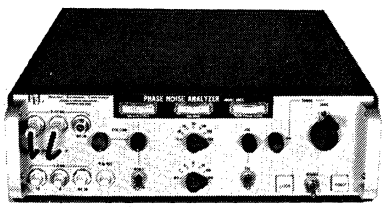
SYSTEM DESIGNED

The 700B is now being used in systems requiring compliance with RFI specifications as demanding as MIL-STD-461. The 700B has been ruggedly designed to meet all the shock, vibration and temperature requirements normally required for terminal environments. The synthesizer will tie directly into your programming logic—without necessity for interface logic converters.

LOWEST COST SYSTEM

Since one basic unit can provide all your L.O. requirements, DC through microwave, multiple usage factor enables considerable cost savings. Allow us to reduce your system cost with a fixed price for your complete L.O. requirements.

Ultimate in phase measurement

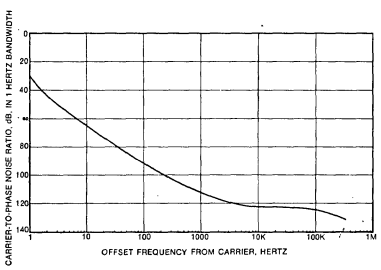


FEL 800B 1-12.4 GHz Phase Noise Analyzer

PLOTS SSB PHASE NOISE DIRECTLY

Tracking loop design allows phase noise measurements within 0.75 Hz of the carrier. SSB Phase Noise Density plots can be made directly using a wave analyzer and recorder.

TYPICAL MEASUREMENT COMPARING TWO S BAND CRYSTAL CONTROLLED SOURCES



MORE FEATURES

The FEL 800B is a Phase Tracking Demodulator which displays phase noise in loop bandwidths adjustable from 5 Hz to 500 Hz and video bandwidths from 300 Hz to 300 kHz over a frequency range of 1 GHz to 12.4 GHz. Readout is directly in degrees of phase noise. The internal reference oscillator and mixer provides a noise floor of −110 dB/Hz at S Band. Using an external crystal oscillator above 90 MHz allows measurements to −125 dB/Hz.

Low price: $3,450 f.o.b.

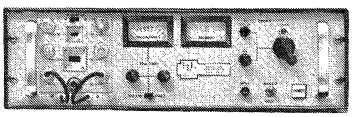
Extraordinary stability



FEL 130A 1-40 GHz Continuously Tunable Synchronizer

STABLE

FEL series 130A synchronizers phase-lock any voltage tunable microwave signal source to its internal precision crystal oscillator. The signal source under lock assumes the inherent stability of the crystal oscillator. Frequency stability is 1 part in 10^8/sec, or 1 part in 10^7/day!

APPLICABLE

Now it is economically feasible to upgrade the stability and resolution of almost any commercially available sweep generator — with little or no generator modification. Wide range of applications includes use with an oscillator source in the research lab, on the production line, or rack mounted for tactical environments . . . to provide an extremely stable signal for microwave frequency standards, doppler systems, MTI techniques, radio astronomy receivers, and parametric amplifier pumps.

FLEXIBLE

Continuously tunable from 1 GHz to 40 GHz, the 130A series is also available in shorter ranges with add-on range capabilities. All solid-state and completely self-contained, the unit may be rack or cabinet mounted. Power consumption is low—less than 60 watts.

DELIVERABLE

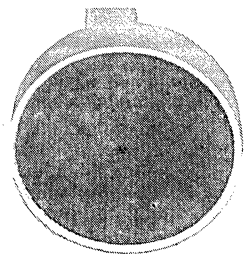
Spiral antennas

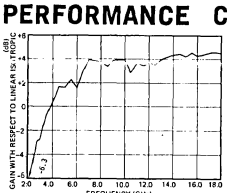


FEL SMK 2018 2-18 GHz Spiral Antenna

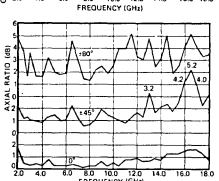
2-18 GHz PLUS SUPERIOR PERFORMANCE, ADVANCED CONSTRUCTION

Now you can specify a single spiral with a frequency range of 2-18 GHz — S, C, X and Ku bands. With essentially constant impedance and circularly polarized performance; excellent gain across the entire bandwidth; and excellent axial ratios and pattern control. Compact, lightweight and rugged, the SMK 2018's unique design protects it from moisture, foreign material and tampering.

PERFORMANCE CURVES



GAIN VS. FREQUENCY

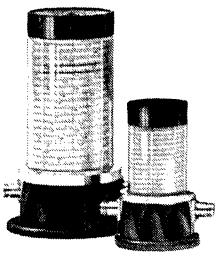


AXIAL RATIO VS. FREQUENCY

SIGNIFICANT APPLICATIONS

ECM, ECCM systems; flush mounted, high performance aircraft antenna elements; EMC and RFI measurements; direction-finding antenna systems; telemetry systems; laboratory source for antenna measurements; elements for broadband circularly-polarized arrays; feeds for paraboidal reflectors; plus many other significant applications.

Twice the frequency range



FEL WDA 940 & WDA 3712 Direct-Reading Precision Frequency Meters

TWO DO THE WORK OF FOUR OR FIVE

Instead of using up to five frequency meters to cover the range from 960 MHz to 12,400 MHz, use only two WDA's. WDA 940 covers 960-4,200 MHz region; WDA 3712, 3,700-12,400 MHz. Readout is direct in MHz.

ABSOLUTE ACCURACY, RUGGED CONSTRUCTION

Designed using temperature-stable, high-Q resonator. Tuning mechanisms feature precision lead screws, loaded to eliminate backlash and ensure resetability. Clearly legible incremental calibration of an extended spiral scale housed within a transparent drum achieves high resolution. Resonance is defined by a sharply defined dip. Special alloys, invar and temperature compensated construction assure smooth operation and minimum wear over extended periods of time.

BROADLY APPLICABLE, ECONOMICAL

Use for measuring cw, am, fm or pm microwave signals. Ideal for frequency measurement of microwave transmitters, microwave receivers, local oscillators and signal generators.

Price of either type: $525

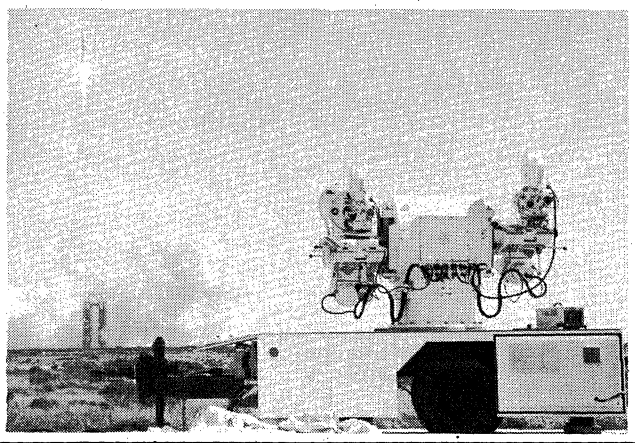
RANGE INSTRUMENTATION EQUIPMENT – PRECISION PEDESTALS

COMPLETE TRACKING SYSTEMS



MOBILE OPTICAL TRACKING SYSTEM

The Mobile Optical Tracking System is a precision, high load capacity, servo controlled position pedestal, mobilized for usage in rugged terrain. It can be controlled locally from the pedestal, or from its mobile control van—or a permanent site—located up to 12 miles from the pedestal.

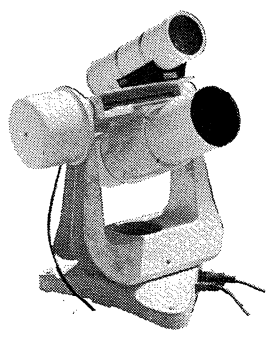
The pedestal is controlled by infrared or TV edge track auto-track systems, or by manual joystick control. The control system features auto-override to allow momentary selection of manual mode, and a coast function allowing the pedestal to continue at the established rate for a minimum of 10 seconds should the target be lost.

Versatility is the key to the control system design. Operational switches allow the operator to select a variety of tracking modes, change system bandwidth, or introduce special functions for ease of tracking and improved accuracy.

The system requires only two hours site installation and collimation time. Two men are necessary for calibration and set-up, but normal system operation is a one-man job. Position accuracy is 2 arc seconds (static) and 0.003 mr/mr/sec (dynamic). Its angular displacement is 345° azimuth, −10° to 90° elevation. Stable tracking rates in the speed range of 5 arc sec/sec to 70 deg/sec may be obtained. Camera platforms are capable of accepting cameras weighing 500 pounds with a maximum load capacity of 1480 pounds symmetrical and balanced. Balancing of the load requires no counterweights, utilizing crank controlled weight displacement for balancing.

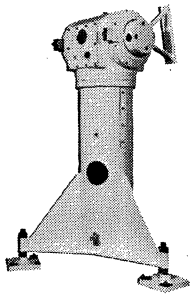
The flexible capabilities of MOTS allows many system variations, making it easily adaptable to the user's specific requirements.

PEDESTALS AND TRACKING EQUIPMENT



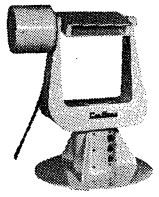
SERVO CONTROLLED INSTRUMENT POSITIONER

This positioner is a rugged, lightweight unit capable of remote control, auto-track, and pre-programming. Handling a symmetrical load of up to 75 lbs., it utilizes dc servo control in a closed loop system.



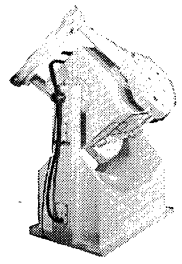
PRECISION SERVO CONTROLLED PEDESTAL

This instrument positioning system features continuous azimuth travel with ±100° elevation, is capable of mounting symmetrical loads up to 200 pounds, and has a positioning accuracy (static) of ±.1°. Along with the solid state servo controller, the complete system can be pre-programmed, operated in a pre-position select or auto-track mode.



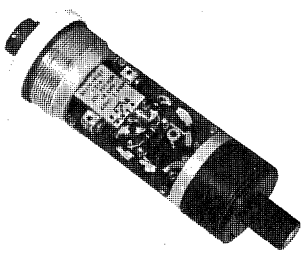
AZIMUTH/ELEVATION POSITIONER

The GSS Model 8175 Azimuth/Elevation Positioner is a lightweight, precision positioning unit capable of remote, manual or autotrack control. The versatile mounting arrangement permits balanced loads of up to 75 pounds with a rated velocity of 30 degrees/second and an acceleration of 30 degrees/second and an acceleration of 30°/sec². Elevation travel is −10 degrees to 190 degrees. Azimuth travel is limited by cable wrap up, or approximately ±180 degrees. Drive power is supplied by a dual-channel, complimentary transistor servo-amplifier.



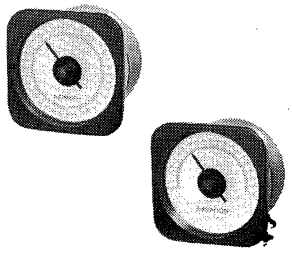
XY PEDESTAL POSITIONER

The XY Pedestal positioning system is a high rigidity antenna positioner capable of maximum sky coverage including target fly-over. A unique X-shaft cam reduces "key hole" around support pillows to a minimum. Instrument loads of up to 1200 pounds can be positioned to .1° static accuracy. The tracking unit rate is 10° per second with a dynamic error of .3° maximum. The maximum acceleration is 35° per sec².



SUN SENSOR AND CONTROL

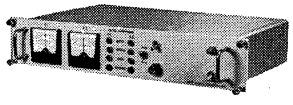
The SS-101 furnishes switch contact closures when an intense light source passes through the field of view. The unit is fully compatible with any electrically driven sun shutter equipment and its light sensitivity threshold is adjustable.



SERVO/SYNCHRO DRIVEN REMOTE AZIMUTH AND ELEVATION INDICATORS

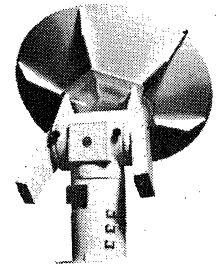
These indicators display remote angular or linear position, or any other calibrated quantity that can be represented by shaft rotation or linear displacement.

A wide variety of dial calibrations, colors, mounting arrangements and synchro ratios can be provided.



AUTO-TRACK INTEGRATION EQUIPMENTS

These solid state units will couple an angle-error sensing device to an elevation-over-azimuth positioning pedestal to achieve a completely automatic tracking system. They also allow addition of a remote manual control (joystick) to the system, provide a provision for automatic switchover to null detector tracking, and allow retention of existing means of pedestal control.



AUTOMATIC TELEMETRY TRACKING SYSTEMS

These systems have been designed using the GSS precision servo controlled pedestal. A variety of antennae from conical scanning telemetry types to helix and cross dipole arrays can be mounted on and positioned by the servo driven pedestal. Antenna polarization can be selectable from remote control. Automatic tracking rates to 30 deg/sec are obtainable.

Design excellence and trouble-free performance are recognized attributes of the Geo Space Systems' servo positioned pedestal equipment that has been developed and manufactured for a number of critical national test range applications.

A staff of professional design engineers and consultants and an experienced field engineering team are maintained to offer a full range of expert services to prospective users.

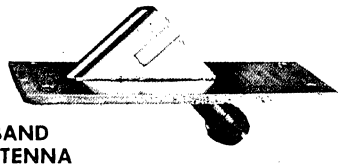
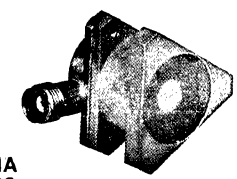
C-BAND ANTENNA
MODEL 845C

Stub Antenna was developed primarily for aircraft application in association with a C-Band radar transponder. The antenna is a vertical polarized omni-directional antenna enclosed within a radome. The antenna is characterized by its compactness and is extremely lightweight while still maintaining the electrical and environmental characteristics required by this type antenna. The height of the radome is approximately three-quarter inch and the diameter of the radome is approximately three-eighth inch. Mounting of the antenna is accomplished via a three-inch diameter mounting plate which also serves as a ground plane for the antenna. **Freq.:** 5.4 - 5.9 GHz; **VSWR:** < 1.5:1; **Beamwidth:** 70°; **Pol:** Vert.; **Power:** 1.5 kw peak; **Connector:** TNC; **Weight:** 1.5 oz.

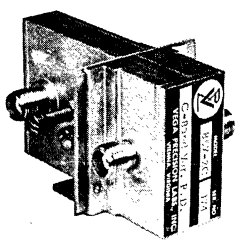


C-BAND ANTENNA
MODEL 801C is a lightweight slotted blade antenna developed as part of a C-Band Radar Transponder System for use on the Nike Apache Vehicle. Linear radiation coverage with minimum aerodynamic drag were key requirements in the design of this antenna. The body of the antenna is constructed of stainless steel which gives excellent reliability in missile environments with no degradation in electrical performance. The antenna may be used as a single element or in multi element arrays depending on the particular application and desired pattern coverage. The companion dividers are Models 853-2C, 854-3C and 855-4C (two-way, three-way and four-way respectively). **Freq.:** 5.4 - 5.9 GHz; **VSWR:** < 2.0:1; **Imp:** 50 ohms; **Pol:** Linear; **Connector:** TNC; **Weight:** < 3.0 oz.; **Power:** 1.0 kw peak.



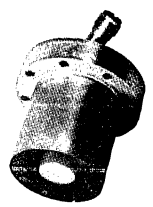
C-BAND ANTENNA
MODEL 820C

Antenna is an optical quartz-loaded, cavity backed helix radiator which produces a right hand circular polarized radiation pattern. The use of quartz material provides for high and low temperature stability with no degradation in electrical performance. Flush mounting is normally used on reentry vehicles with no performance deterioration as a result of reentry heat. Low thermal conductivity of the quartz material controls the heat transfer from the face of the antenna so that very little reentry heat is conducted to the antenna connector. This permits the use of standard mating connectors. Companion power dividers Models 853-2C, 854-3C and 855-4C are used for arraying two, three or four antennas about the missile. **Freq.:** 5.4 - 5.9 GHz; **VSWR:** < 1.5:1; **Pol:** RHC; power 1.5 kw peak; **Gain:** 6.0 db; **Beamwidth:** 130° **Temp.:** 1700° front surface exposure; **Weight:** < 2.0 oz.; **Shock:** 300 g's.

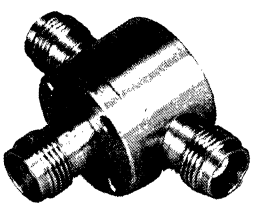


C-BAND POWER DIVIDER

MODEL 857-2C Variable Power Divider was designed to divide the output power of a C-Band Radar Transponder equally between two antenna elements when mounted in airborne vehicles and using unequal lengths of coaxial transmission lines. The design is such that the output power to each leg can be varied from a balanced condition to that of all power in either output leg. With the power divider adjusted to compensate for unequal cable losses, equal power will be radiated by each element of a two element array. The input VSWR is less than 1.3:1 and is tunable over the frequency range of operation. Also available are Models 856-2S (S-Band, 2.7 - 3.0 GHz) and 858-2X (X-Band, 9.1 - 9.6 GHz). **Freq.:** 5.4 - 5.9 GHz; **Insertion Loss:** < 0.5 db; **Power:** 1.0 kw peak; **Size:** 3 1/4" x 2 1/2" x 2"; **Weight:** 12 oz.

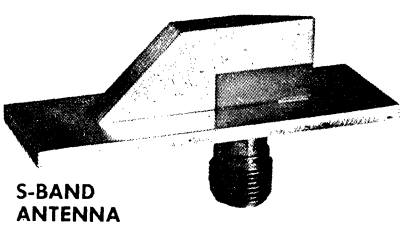


S-BAND ANTENNA
MODEL 815S was developed as part of a lightweight S-Band Antenna System for use in the Nike Tomahawk missile for purpose of transmitting tracking data. The antenna is a cavity backed helix with the helix embedded in quartz which is also used as the dielectric cavity. Mounting is accomplished via a mounting flange which can be adapted to a variety of mounting configurations. Flush mounting is used on reentry vehicles with no performance deterioration as a result of reentry heat. Low thermal conductivity of the quartz allows little of the heat to be conducted to the antenna connector therefore standard mating connectors may be used. A C-Band version of this antenna is also available. **Freq.:** 2.7 - 2.95 GHz; **Pol:** RHC; **Gain:** 7.0 db; **Beamwidth:** 130° nominal; **VSWR:** < 1.5:1; **Temp:** 1000° F, front surface exposure; **Vibration (random):** 48 g. rms; **Shock:** 78 g; **Acceleration:** 100 g.



C-BAND POWER DIVIDER

Model 853-2C and 855-4C, three-way and four-way respectively, are also available. The body of the power divider is constructed of stainless steel which gives exellent reliability in missile environments. The interior of each power divider consists of an output arm which goes through one or more transformer stages, and then couples with two or more output arms to complete the power division. Each power divider has pre-drilled holes for mounting purposes. **Freq.:** 5.4 - 5.9 GHz; **VSWR:** < 1.3:1; **Imp:** 50 ohms; **Insertion Loss:** < 0.5 db; **Power Div:** ± 0.5 db; **Power:** 1.5 kw peak;; Weight: 853-2C, 2.3 oz.; 854-3C, 2.5 oz.; 855-4C, 2.7 oz.



S-BAND ANTENNA
MODEL 802S

Slotted Blade Antenna was developed for Telemetry and Command functions on the Nike Apache vehicle. The antenna provides linear radiation coverage with minimum aerodynamic drag. The body of the antenna is constructed of stainless steel which gives excellent reliability in missile environments with no degradation in electrical performance. The antenna may be used as a single element or in multi element arrays depending on the particular application and desired pattern coverage. The companion power dividers are Models 850-2S, 851-3S and 852-4S (two-way, three-way and four-way respectively). **Freq.:** 2.2 - 3.3 GHz; **VSWR:** 2.0:1; **Imp:** 50 ohm; **Pol:** Linear; **Power:** 1.0 kw peak; **Connector:** TNC; **Weight:** < 2.0 oz.

OEM POWER MODULES "OFF-THE-SHELF" SPECIALS

AC to DC • DC to DC • DC to AC

If there is one thing our years of experience in the power supply industry has taught us — it is versatility. An example is our new M Series OEM power modules. Besides a wide input range suitable for international use, this line has efficiencies as high as 80% and may be operated interchangeably from both AC and DC power sources. It was also designed to fit into small spaces, providing nearly 2 watts per cubic inch.

In addition to the more popular voltage and current levels listed below, any output voltage between 2 and 5000 volts DC can be provided in currents of up to 100 amperes — to a maximum of 1000 watts (500 watts in the M2 Series). Dual and multiple outputs are available in all model series, with high precision tracking available in the M2 Series. We call this our "Off-the-shelf Specials" capability.

But one basic design is not going to solve the world's power supply problems. In fact, each system is a special, and in many cases a standard power supply cannot be used without sacrificing system performance requirements. You may need a 5 to 1 input range, 90% efficiency, miniaturized packaging or 0.001% regulation. Or you might want to design for a particular cost range. Whatever it is — give us a call. Versatility is our business.

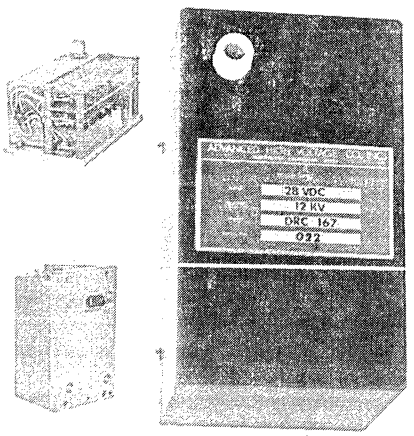
High Voltage Modules for Photomultipliers and CRT'S



features

Line regulation .05% on all models.

Output voltages listed are nominal values. They are adjustable ±10% and can be remotely programmed. Wider adjustment range is optional.

T/C of 100ppm is standard.

Units shown normally have a positive output. Negative output furnished at no extra charge.

The output DC return on all units can be floated within 500 volts of chassis.

All units are short-circuit-proof and can remain shorted indefinitely without damage. They will recover automatically after removal of short.

Operating temperature range is normally −20°C to +65°C but can be increased at nominal cost.

All AC input models will operate from a single phase 117VAC, 50 to 420Hz line.

DC input models use 28VDC. Other input voltages can be supplied.

Units are shielded and have no external magnetic field.

Units are built to best commercial standards and can meet most MIL specs.

DRC Series is built to MIL-E-5400 and MIL-STD-704 and other applicable specs.

DRC Series has a focus voltage output.

The following is only a partial list of models offered by Advanced High Voltage. Write or phone for our complete catalog.

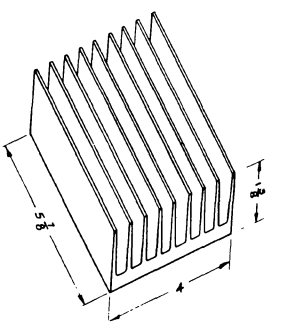
OUTPUT CURRENT VS TEMPERATURE

1) CONDUCTION COOLING — Mounting Surface 1 should be attached to a heat sink plate or chassis. The percentage of rated output current that may be drawn from any "Z" model at various mounting surface temperatures is indicated by Curve ①. Thus, 100% of the rated output current may be drawn at a **mounting surface temperature** of 75°C.

2) CONVECTION COOLING — A thermal finned radiator, Model TRZ1, may be attached to Mounting Surface 1. Using Mounting Surface 2, install the unit with fins in a vertical position. Curve ② indicates the percentage of rated output current that may be drawn from any "Z" model in this configuration at various **ambient temperatures.** Thus, 100% of the rated current may be drawn at 50°C **ambient temperature.** Model TRZ1, shown at right, adds 1⅜" to Dimension "C." Price is $4.00 each for 1 to 4 pieces.



3) RADIATION COOLING — Units may be installed on Mounting Surface 2 with **no** additional **heat sinking.** The percentage of rated current that may be drawn from any "Z" model at various ambient temperatures is indicated by Curve ③. The ambient temperature should be measured with ¼ inch of Mounting Surface 1 in still air. Thus, 100% of the rated current may be drawn at 35°C **ambient temperature.**

If you have a size problem, this line of power modules may help you. Abbott's modular packaging techniques provide small, lightweight, 60 Hz to DC power modules. This family of Abbott power modules is called the V/HA series. The next two pages list 300 models to supply any voltage you require from 5 to 740 VDC. Output power levels are from 5 to 240 watts.

These units are hermetically sealed and encapsulated to meet severe environmental conditions of fungus, sand, dust, humidity, salt spray, etc., per MIL-E-5272C. The power module case is made of electro-copper plated steel. It is fused to a ¼ inch thick Aluminum base. These modules can be used in tropic, arctic, desert, and sea environments, as well as in the laboratory. The predicted reliability of these power supplies has been calculated in accordance with the Military Handbook MIL-HDBK-217. The failure rates of each of the component parts, transistors, resistors, etc., have been carefully calculated **for their worst case operation** and then added up and converted into the expected hours that the power supply will satisfactorily operate before a failure will occur. The typical Mean Time Between Failure (MTBF) for these units is 84,000 hours. Copies of formal reports are available, on request, from our factory. More significant, however, is the fact that these Abbott modules are being used in many different Military and Industrial systems throughout the world and have a proven reliability history.

SPECIFICATIONS

INPUT VOLTAGE RANGE: 24 to 30 vdc.

LINE REGULATION: 0.1% or 10 mv (whichever is greater) for input change of 24 to 30 vdc with load constant.

LOAD REGULATION: 0.1% or 20 mv (whichever is greater) for load change of no load to full load with line constant.

RIPPLE: 0.02% or 5 mv RMS (whichever is greater) 50 mv peak-to-peak maximum, measured with scope having a bandwidth of 1 MHz.

OUTPUT VOLTAGE ADJUSTMENT: Voltage is continuously adjustable between the limits shown in the table by means of an externally accessible screwdriver adjustment potentiometer.

ADJUSTMENT RESOLUTION:

Nominal Output Voltage	Resolution
5 thru 16 vdc	35 mv max.
18 thru 50 vdc	60 mv max.

SPECIFICATIONS

INPUT VOLTAGE RANGE: 24 to 30 vdc.

LINE REGULATION: 0.2% or 10 mv (whichever is greater) for input change of 24 to 30 vdc with load constant.

LOAD REGULATION: 0.2% or 20 mv (whichever is greater) for load change of no load to full load with line

RIPPLE: 0.02% or 5 mv RMS (whichever is greater), 50 mv peak-to-peak maximum for each output, measured with scope having bandwidth of 1 MHz.

TRACKING ACCURACY: The negative output will track the positive output to within 1.0% or 100 mv (whichever is greater) for all rated conditions of input voltage, output current, operating temperature, and output voltage adjustment.

OUTPUT VOLTAGE ADJUSTMENT: Voltage is continuously adjustable between the limits shown in the table by means of an externally accessible screwdriver adjustment potentiometer.

ADJUSTMENT RESOLUTION: 25 mv for outputs up to ±4.5 vdc; 35 mv for outputs ±5.0 to ±15 vdc; 60 mv for outputs ±16 vdc and above.

ISOLATION VOLTAGE: 200 volts DC between input and output, input and case, and output and case.

INSULATION RESISTANCE: 50 megohms minimum at 50 volts DC between input and output, input and case, and output and case.

POLARITY: Inputs and outputs are isolated; either positive or negative side may be grounded.

TEMPERATURE RANGE: Operating: −55°C to +100°C maximum at center of mounting base. Storage: −55°C to +125°C.

TEMPERATURE COEFFICIENT: 0.03% per degree centrigrade maximum.

ENVIRONMENT: Encapsulated to meet the environmental requirements of MIL-E-5272C and MIL-E-5400K, Class 2, including altitude (to a vacuum), vibration, shock, acceleration, sand, dust, humidity, saltspray, fungus, explosion, etc.

SHORT CIRCUIT PROTECTION: Each unit is completely protected against an overload or short circuit of any duration. The output voltage automatically restores to normal when the overload is removed.

INPUT TRANSIENT PROTECTION: In accordance with MIL-STD-704A, Figure 9, Limit 1 (80 vdc for 0.1 sec.).

OVERVOLTAGE PROTECTION: Overvoltage protection modules are available for use with these units. Please consult the factory.

LOAD TRANSIENT RECOVERY TIME: Output voltage returns to regulation limits within 200 microseconds after a 50% step change in load current.

ELECTROMAGNETIC INTERFERENCE: Built to meet the requirements of MIL-STD-461 for generation of and susceptability to radiated and conducted interference.

RELIABILITY: The mean time between failure (MTBF) per MIL-HDBK-217 under worst case operating conditions of full rated output current, 30 vdc input voltage, and +100°C base plate temperature, range from 20,105 hours for Model CC30D3.5 to 34,710 for Model CC3D3.5.

Mil Specs	The listed catalog models are constructed with the highest quality components and have MTBF ratings in the neighborhood of 50,000 hours per MIL-HDBK-217. ACDC will also build supplies to meet specific MIL specs such as MIL-E-4158A, MIL-E-16400, MIL-T-21200, and meet environmental requirements such as MIL-E-5400, MIL-E-5272, MIL-E-4970, and RFI specs MIL-I-26600 and MIL-I-6181. ACDC is able to perform qualification testing when required. In order to provide the most efficient design, customer inquiries are invited, outlining exact specifications and environmental conditions required for the end product.					
Overload Protection	All models are inherently protected against overload and short circuits of any duration. Except for certain higher voltage units, no fuses or reset buttons are used — automatic recovery is electronically accomplished. On higher voltage units, short circuit protection is furnished by means of an accessible, replaceable fuse.					
Overvoltage Protection (Optional)	Any model, up to 50 volts, can be furnished with overvoltage protection which "crowbars" the output in the event of a rise in the output voltage of 10% or 2 volts (whichever is greater). On dual models, overvoltage protection "crowbars" both voltages to near zero in the event of a rise of one or both of the voltages of 20% or 4 volts (whichever is greater). (fixed on CD series)					A completely independent overvoltage protection module is available and straddles the output terminals. This protection does not depend on the regulating circuitry of the supply. Trip voltage adjustable from 5-30 volts.
Connector	All cases have barrier strip termination.	Power supply mates with standard PC edge card connector (22 x .156 x 1/16" thick) Barrier strip available as option	All cases have barrier strip termination.	Cases A through F are supplied with a solder hook terminal header. Case M1 is furnished with an attached 10 terminal PC edge connector which may be used either as a solder connection or readily removed by the user and mounted in his equipment to provide plug-in convenience. G and H cases have barrier strip termination.		All cases have barrier strip termination.

RACK MOUNTING CAPABILITY

acdc
POWER SUPPLIES

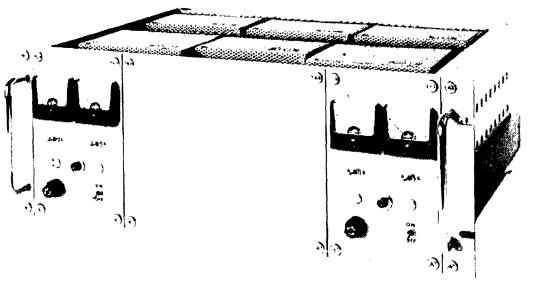
Universal 19″ rack adapters are available for mounting any ACDC power supply module. There are no holes to drill — just assemble the power supply mounting plates with the hardware furnished with each rack adapter.

The chassis is cadmium plated and the rear panel is prepunched for eight and ten terminal barrier strips to which cabling can be terminated.

A variety of front panels are also available. Blank panels, metered panels and switch panels are furnished in grey enamel. The 3½″ metered panels have two 1½″ meters for monitoring voltage and current, and the 5¼″ and 7″ panels are also equipped with two selector switches so that two outputs can be monitored. Switch panels contain a line switch, red pilot light and fuse holder.

When ordering, specify the desired rack adapter and power supply modules that will be mounted in the assembly. (We will then provide you with the required special hardware and installation drawing free with your order.) Then choose the front panels you need, a set of slides, and your ACDC rack mounted power supply assembly is complete!

The following chart lists the cases that can be accommodated in each rack adapter. Contact your ACDC representative or the factory for the exact total module capacity once the required combination is chosen.



ACDC Rack Assemblies will accept all of the new OEM series modules.

	3.50″ rack will accommodate A1, J1, J2, M1, K1, R1, R2		5.25″ rack will accommodate all the models listed for the 3.50″ rack plus B1, C1, D1, L1, N1, P1, R3, R4, R5		7.00″ rack will accommodate all the models listed for the 3.50″ rack and the 5.25″ rack plus E3, F2, G1, H1

Voltmeters are readily available with the following full scale ranges: 10v, 30v, 50v, 100v, 500v. (Other ranges on special order)

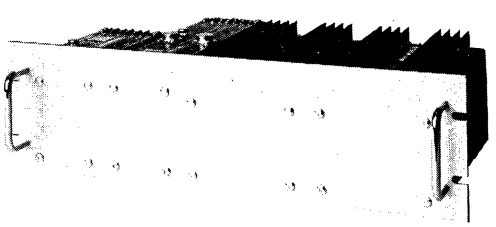
Ammeters are readily available with the following full scale ranges: .25A, .5A, 1A, 3A, 5A, 10A.

Ammeters that require a shunt are also available for the following ranges: 15A, 25A, 50A, 100A, 150A.

All applications where a single ammeter monitors 2 outputs requires one meter and 2 shunts.

Refer to the ACDC Catalog #371 or consult factory for additional ordering information.

PANEL MOUNTING CAPABILITY



A simple and economical way to rack mount ACDC's modular power supplies. It is ideally suited for mounting the OEM Series where the weight is carried close to the panel, and the barrier strip projects toward the rear for easy wiring into other rack drawers.

Standard panels are funished in 18 Ga Steel (.119) cadmium plated and painted light grey. Handles are 5/16″ round brass, nickel plated. You may order panels with handles either blank, or drilled to mount ACDC power supply modules, or custom drilled to your specifications. Complete assemblies with power supply modules mounted and wired can also be furnished.

Pick out the ACDC power supply modules you need and we'll show you the panel configuration that meets your requirements.

A-MP* SOLID STATE HIGH VOLTAGE POWER CONVERSION

FOR COMMERCIAL AND MILITARY APPLICATIONS

The CAPITRON Division of AMP Incorporated has complete in-house facilities for designing and manufacturing power assemblies, including metal forming, printed circuit board fabrication, magnetics winding, encapsulating, and environmental testing. In addition, the use of AMPLIFILM* capacitor products enables CAPITRON engineers to design higher power into smaller packages for both military and commercial applications.

Solid state and conventional units are characterized by tight regulation, low ripple voltage, and dense, rugged construction. All are pre-engineered to specific customer requirements.

The rack and panel mounted multiple output supply shown is intended for use in normal office environments. All output voltages and current are read from a single panel meter. All voltages are short-circuit proof and a system malfunction will turn off the 17 KV output until it is reset.

A unique feature is the operation of the "power present" indicators: Low input line voltage turns off logic circuits, all supplies and indicators; high output voltage from any supply turns off logic, but not output power; overcurrent from any supply turns off its logic and its indicator.

SPECIFICATIONS:

Adjustable outputs	17 KV, 1 KV
Fixed output	400 V
Current ranges	0.1 to 1 ma
Regulation	.01% to 1%
Ripple	.05%

Also available are special purpose power supplies for CRT, Energy Storage, Laser, Traveling Wave Tube and Programmable applications. The CAPITRON Division is equipped to satisfy special design requirements on short notice.

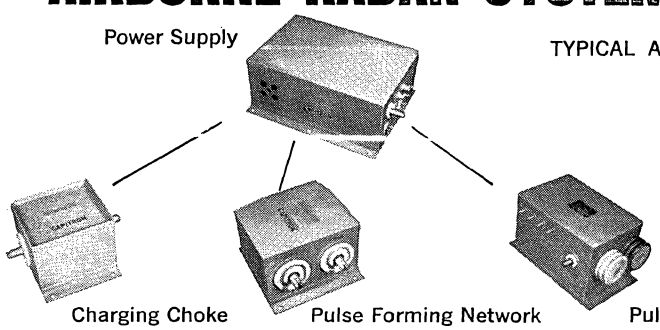
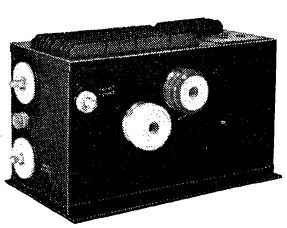
AIRBORNE RADAR SYSTEMS AND COMPONENTS



TYPICAL AIRBORNE RADAR POWER CONVERSION SYSTEM

A compact 4-module pulse system with extremely good heat sinking and klystron filament voltage regulation between 7.35 and 7.75 volts at 2 to 2½ amps. Maximum pulse ripple is only 1.0%. The largest unit is approximately ½ cu. ft. in size and weighs less than 12 lbs.

Pulse Modulator for Airborne Radar



This oil-filled pulse modulator is designed to drive the V-24 klystron family. Offering maximum power (300 KW peak) for minimum size, it has excellent square wave characteristics, providing pulses of long duration for the required repetition rate. A unique heat sinking technique effectively removes 400 watts of heat, permitting operation at 107°C ambient temperature. The package also supplies klystron input voltage variation tightly regulated to 9 +.5V/−0V with variations in temperature from −7 to 107°C, filament power from 107.5 to 119.5 volts, load current from 2 to 2.5 amps, and input frequency from 380 to 420 cps.

Performance Specifications
Input: 5 KVDC ±.25 KVDC @ 510 ma.
Output: 40 KV @ 7½ amps. 1800 pps for search followed by 2235 pps. for indefinite duration
Pulse: 2.1 μsec. read at 100% amplitude; 0.5 μsec. rise time; 0.9 μsec. fall time; 1.5% max. ripple; 10% max. backswing
Ambient Temperature: −7° C to +107° C (operational); −60° C to 121° C (storage)
Size: 10¼″ x 4¾″ x 5⅞″
Weight: 26 lbs. max.

DC TO AC UNIVERSAL INVERTERS

New, universal inverters for operating 110-v., 60 cycle AC equipment from DC voltages in autos, buses, trucks, boats, trains, planes and DC districts. Designed especially for standard 110-volt AC tape recorders, TV sets, radios, PA systems, electric razors, test equipment, etc. Units are carefully engineered and ruggedly constructed to provide long life operation. All feature complete RF interference suppression and exceptional frequency stability. Have operating efficiency in excess of 75%. Four-point voltage regulator corrects output voltage for minimum and maximum loads, and also helps compensate for input voltages lower or higher than normal. Inverters are recommended for use with loads having power factors in excess of 70%. Built-in toggle switch selects most efficient operation for use with TV sets or tape recorders. Inverters are not recommended for use with large motor driven appliances such as refrigerators, washing machines, etc. All have On-Off switches. Housed in attractive brown hammerloid metal cabinet with convenient leather carrying strap. Sizes: Standard Model RSF, 8½x9⅞x5¼"; Heavy-Duty Model RHG, 6⅞x11¼x 8½"; Extra-Heavy-Duty Model HSJ, 6½x12⅞x8½". With battery clips for instant connection to power source. Models with "P" suffix equipped with adapter cord for use in auto cigarette lighter receptacles. *Recommended for 24 volt battery operation. **Before ordering, check wattage of equipment with which inverter will be used.**

These Inverters are very well filtered and feature quick starting, frequency stability with varying load and input voltage, rugged heavy-duty construction, reverse polarity protection, and built-in power factor corrector utilizing a simple toggle switch. With ATR Inverters, the need for special equipment is eliminated. They are designed for quiet, long-life operation at high efficiency and maximum reliability. All models indicated here are equipped with heavy duty power transistors and plug-in frequency reed for automatic frequency control. These Inverters also come equipped with four-point voltage regulators which make possible the correct output voltage for minimum to maximum loads and also help compensate for input voltages which are lower or higher than normal. The operating efficiency is approximately 80%. To figure approximate current consumption from storage battery, divide the rated input wattage of the load being operated by the storage battery voltage, and further divide this answer by .80 which will give the approximate current consumption from the battery based on the actual load being operated. These Inverters are recommended primarily for use with loads having power factors in excess of 70%. Inverters come complete with battery cables ready for operation.

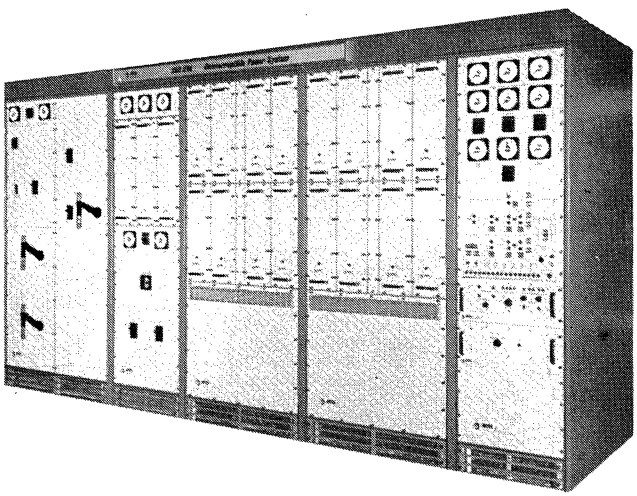
UPS UNINTERRUPTIBLE POWER SYSTEMS

AVTEL

On-line solid state AC power systems which guarantee uninterrupted, transient-free power to your critical equipment, regardless of power line conditions.

CONDITIONED POWER

AVTEL's Uninterruptible Power Systems (UPS) offer the maximum in reliability and efficiency for applications where even a momentary power failure or disturbance cannot be tolerated. High mean-time-between-failure (MTBF) coupled with modular construction for low mean-time-to-repair (MTTR) make Avtel UPS the most practical systems for continuous on-line operation.



1.25 KVA Mini-UPS to Systems Over 1000 KVA

AVTEL UPS ARE DESIGNED TO PROVIDE THESE OUTSTANDING ADVANTAGES:

True Sinewave Output: The maximum harmonic distortion under the worst combination of conditions is less than 2%. Under normal operating conditions, less than 1.5% is typical.

Tight Frequency Control: The output frequency is completely unaffected by load and line variations. If desired, the output frequency can be phase-locked to the commercial line or other reference source. 0.5% stability is standard.

Minimum Maintenance: Modular construction throughout permits quick access to and exchange of any component. A MTTR of less than 30 minutes is typical. Cleaning the air filter is the only required preventive maintenance, other than battery watering. In non-redundant systems, the by-pass switch is used to supply power to the critical load directly from the commercial lines during maintenance.

Low Cost of Ownership: Avtel's low maintenance, high efficiency and trouble-free operation yield substantial savings over other approaches to uninterruptible power. This advantage becomes increasingly significant with time, and savings of over 50 percent overall in ten years ownership are not improbable.

Silent Operation: Unlike rotary systems which produce substantial noise and vibration, these compact and silent units can be installed in close proximity to the load with which they are associated thereby avoiding expensive installations.

High Power Density: These systems are the smallest and lightest yet offered in these power ranges. For example, a 125 KVA system occupies only 35 square feet of floor space, exclusive of batteries.

Unprecedented Efficiency: Operating efficiencies frequently exceed 85%. This low dissipation allows laboratory operation without special cooling considerations.

RFI Suppression: Careful and effective filtration of both the input and output lines, together with ample shielding afford RFI attenuation far superior to other uninterruptible systems.

Choice of Outputs: Avtel's UPS can be ordered in standard 460 V, 60 Hz models or 50 Hz versions at voltage levels found in overseas installations. A complete line of 400 Hz models is also available.

Rapid Response Time: Regulation response time is typically faster than 9 ms at nominal line conditions for a 100% step load change.

AVTEL SOLID STATE TRANSFER SWITCH

Figure A

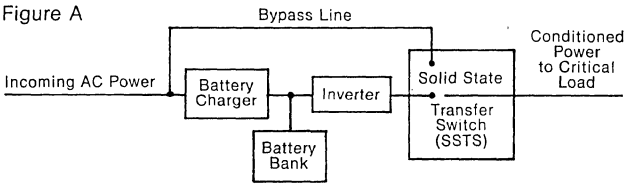

Figure B

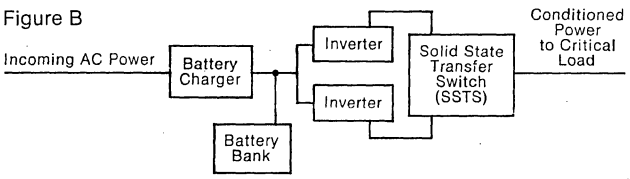

Figure C

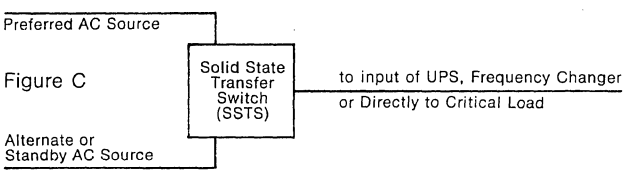

50 MICROSECOND TRANSFER TIME

Avtel's revolutionary solid state transfer switch (SSTS) represents a significant breakthrough in handling AC power. Available in single or three-phase configurations in power levels up to hundreds of KVA, Avtel's SSTS is capable of a complete power transfer between unsynchronized sources in typically 50 microseconds. 500 microseconds is worst-case under any conditions. Internally protected against overloads and short circuits, Avtel's SSTS has many applications. As an optional accessory for an Uninterruptible Power System or Frequency Changer (Figure A), the SSTS can be used as an automatic bypass to transfer power back to the input line in the event the inverter output exceeds specifications units. It can be used for paralleling inverter outputs in redundant system configurations (Figure B). In such systems the inverters are normally sharing the load but in the event of internal failure the faulted inverter is switched off line. If desired, this sort of system can be configured so that one or more inverters are on line and the others off line. The switch then selects on a preferred basis. The SSTS can also be used independently of an UPS (Figure C) for selecting between preferred (prime) and alternate (standby) power sources.

To effectively achieve transfer upon the degradation of on-line power without creating constant switching due to load transients and the like, Avtel has developed a unique high-speed sensor which is capable of distinguishing faults from normal line deviations yet triggering the SSTS whenever an actual problem occurs.

SOLID STATE AC POWER FOR CRITICAL APPLICATIONS

AVTEL

PROTECTION CIRCUITS

Load: Widely adjustable current limiting capability can be set to the maximum normal requirements of the load. In the event of load malfunction, the unit will become a constant current source at the set limit.

Overload: The unit cannot be damaged by any overload or short circuit of transient or indefinite duration. Finite overloads are permitted for periods inversely proportional to the magnitude of the overload. When the permissible overload limitations are exceeded, the output voltage will reduce to such value as necessary to produce the load current limit set by the current adjust control. If the load instantaneously exceeds 150% of ratings, the output voltage will reduce to zero. If the load is gradually increased, the current will limit at 125% or the set point, whichever is lower. Reduction of the load to specification limits or current control settings will automatically reinstate normal operation.

Overheat: The output is interrupted by thermo-switches in the event of excessive internal temperatures. In such event, the cooling fan continues to operate and upon reduction of internal temperatures to specification limits, normal operation is automatically reinstated.

Backup Protection: The input power line is protected by a toggle-operated magnetic circuit breaker which doubles as the primary input and power switch. In the event of electronic protection circuitry malfunction or component failure in the power system, these breakers will prevent consequential damage to the unit, its load or the input power source.

LOW POWER SOLID STATE FREQUENCY CHANGERS

AVTEL

TR SERIES

250-2000 VA—45 to 450 Hz Input. 50/60, 400, 800, or 1600 Hz Output available on most models.

The low power Avtel TR Series Frequency Changers are all transistorized sources of conditioned AC power. Available in 20 standard models from 250 VA to 2000 VA, the TR Series supplies output frequencies in four different bands: 45-66 Hz, 350-450 Hz, 700-900 Hz, and 1500-1700 Hz.

The unique design of TR Frequency Changers ensures that output waveform and frequency are unaffected by changes in the load. The unit is quiet, maintenance free, and impervious to overloads and short circuits. Avtel's TR Series Frequency Changers are the ultimate solution to smaller load applications where well-regulated AC power is essential.

Single Phase & Two Phase Output

Standard 3 phase amplifiers may be used to provide a 2 phase output at ⅔ of rated output power. Special plug-in oscillators are available with selectable 90° or 120° phase separation for 2 phases or 3 phase operation respectively.
Standard 3 phase amplifiers may be used to provide a single phase output at 57% of rated output power over an adjustable voltage range of 110-125 volts.

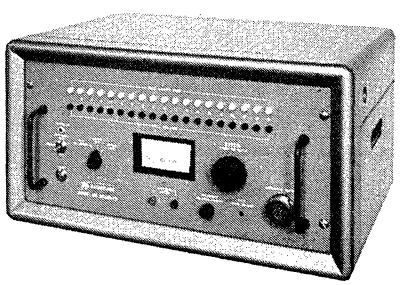
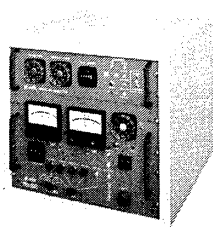
MODEL 50 BATTERY CELL SCANNER for AUTOMATIC CELL TESTING



The Model 50 Battery Cell Scanner provides a simple economical and automatic method of testing individual battery cells under conditions of discharge, charge, float, etc.
The Model 50 is designed for a maximum of 19 cells, the Model 50A for a maximum of 23 cells. However, any number of cells can be accommodated utilizing the Models 50 or 50A in the required number of multiples.
During operation, white pilot lights indicate cells being scanned; a red light, which remains ON until manually reset, indicates which cell is at fault. Although scanning is completely automatic, the automatic cycle may be interrupted and a manual voltage check can be instituted at any time. For production testing of similar batteries, a battery-fixture may be used.

MODEL ANDAC 12-30-101 BATTERY CHARGER/DISCHARGER/ANALYZER



The Model ANDAC 12-30-101 automatically analyzes battery charge-discharge capacities, or can be operated as a manual charge or discharge unit. The equipment consists of two modules packaged in a single cabinet. The first is the basic power unit utilizing SCR rectifiers with associated termination controls, calibration, switching and indicating circuits. The second, or analyzer module consists of logic and timing circuitry that automates and switches the constant current charge, discharge, voltage and timing termination circuits of the power unit.

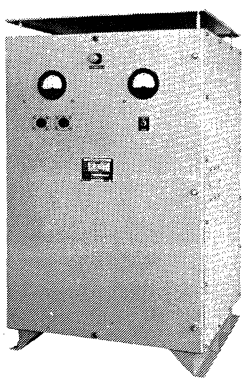
- Designed specifically for 24 volt Nickel Cadmium Aircraft Batteries.
- Ideally suited for charging helicopter batteries . . . reduces battery maintenance.
- Most efficient charge method — constant current charge with topping mode. Charges battery to absolutely full capacity.
- Compact and lightweight . . . can be carried on the aircraft.
- Three selectable charge modes.
- Ideally suited for charging helicopter batteries.

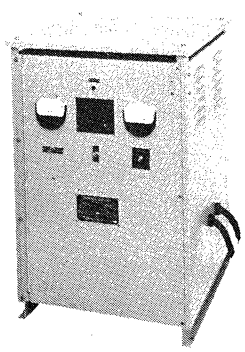


The Model 30 Battery Chargers cover charge current ratings from 6 to 30 amps for use on nickel cadmium aircraft batteries presently in common use. The chargers are uniquely suited to efficiently charge 24 volt aircraft batteries rated at up to 60 ampere hours.

The charger also features a constant current charge mode without topping as well as a float charge mode, to maintain battery at full charge during long periods of storage. The three charge modes are selectable by means of front panel selector switch.

MODEL 45-140BC FORK LIFT TRUCK BATTERY CHARGER

- Fast recharging. Will recharge 720 AH battery in less than 8 hours — smaller batteries in less time.
- Charges both lead-acid and nickel-iron batteries.
- Fully voltage regulated — current limited.



MODEL 45-140 BC is suitable for recharge of electric fork lift truck batteries of the sizes listed in specification W-C-260b. The unit is extremely rugged and reliable by virtue of its fully magnetic power circuitry (saturable reactors) and the solid state (controlled rectifier) regulating control. Recharge of fork lift truck batteries is extremely tough duty and the application of saturable reactors for control of the charge is ideal to its inherent current limiting characteristic and ability to withstand heavy loads.

The magnetically gated controlled rectifiers provide the regulation performance necessary to insure full recharge within the alloted time.

800T-SERIES PLUG-IN OSCILLATORS

Companion Plug-in Oscillators are available in three types: (A) General-purpose, fixed-frequency; (B) Crystal-controlled, high-stability fixed-frequency; and (C) Continuously variable frequencies. All may be used with the Solid-State Invertrons® to create 1ϕ, 2ϕ, or 3ϕ custom AC power sources tailored to exact requirements. The fixed-frequency oscillators may be ordered with a servo-feedback option for systems requiring extremely high amplitude stabilities and accuracies. This feature provides overall regulation of up to 0.01% against line and load changes.

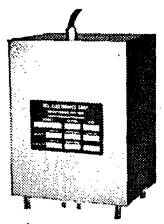
REGULATED MODULES TRANSISTORIZED SERIES "TRHV"



The TRHV series of regulated power supplies are all solid state units. Reference and regulating circuitry is accomplished at low voltage. The units are completely self-contained and require only 115 Volt AC 60/400 cycle excitation to be operative. These supplies are rugged and feature good line, load and thermal stability. The operating temperature range is −20°C to +55°C. Regulation better than 0.25% for 10% line change & NL to FL. Ripple 0.5% RMS at max current.

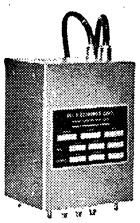
UNREGULATED MODULES COMPACT HIGH VOLTAGE SERIES "S"



These power supplies are designed for operation from either a 0-115 volt or 0-125 volt line at 60/400 cycles. Three input terminals are provided to permit proper line connection. The output is available from shielded polyethylene cables and may be varied over the full range by varying the input AC line. The two output cables are insulated for the full output voltage, so that either the positive or negative terminal may be grounded.* All units have selenium rectifiers and are hermetically sealed in an epoxy, vacuum filled, metal case.

Units for 50 cycle operation at various line voltages are available on request.

*Model 40-2-4 is designed with one output cable for single polarity operation. When ordering, please specify polarity.

Illustrated at right is the Model 3-1743 presently in production for use with a keyboard logic circuit. Suitable for minicomputers, calculators, remote CRT terminals, etc.

Dynamic Instrument Corp. has designed, developed and patented a complete range of low-voltage, filtered, transistor-regulated power supplies and chargers designed to supply the necessary power to a vast variety of Electronic equipment.

Utilizing a wall plug-in type unit eliminates or greatly reduces the problems involved with UL listing your product. They also remove the major heat source, reduce size and weight, and also greatly increase your design flexibility. The latest design applications of the Dynamic wall plug-in supplies are in conjunction with such sophisticated equipment as mini-computers, calculators, keyboard logic circuits, and remote CRT Terminals.

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem**, the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

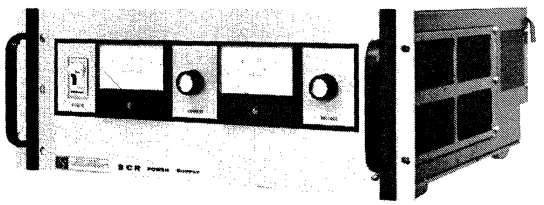
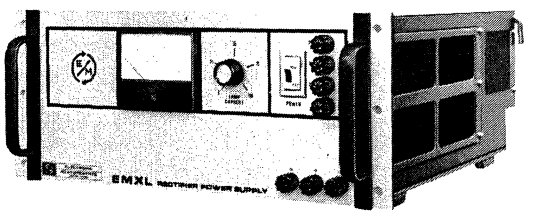
The SCR Power Supplies are high efficiency, high power units designed for a wide range of applications where both precise constant current and constant voltage operation are required. Competitive comparison shows E/M power supplies have lowest voltage ripple, more watts per cubic inch and per pound.



The EMX Power Supplies are specifically designed as constant current sources for Xenon and other high pressure lamps. The EMX series provides stable light output and features automatic starting, igniter pulse timing control, output current adjustment and provisions for certain remote functions. Low lamp current ripple insures maximum life.

EMX 1600	$ 795	— 1600W Lamp
2500	895	— 2500W Lamp
6000	1,150	— 6000W Lamp



The EM Power Supplies have the same advantages and the same applications where the precise regulation of the SCR Power Supply is not required. The EM Power Supplies are a low-cost 1% regulated voltage and current DC source in the medium power ranges up to 10 kw.

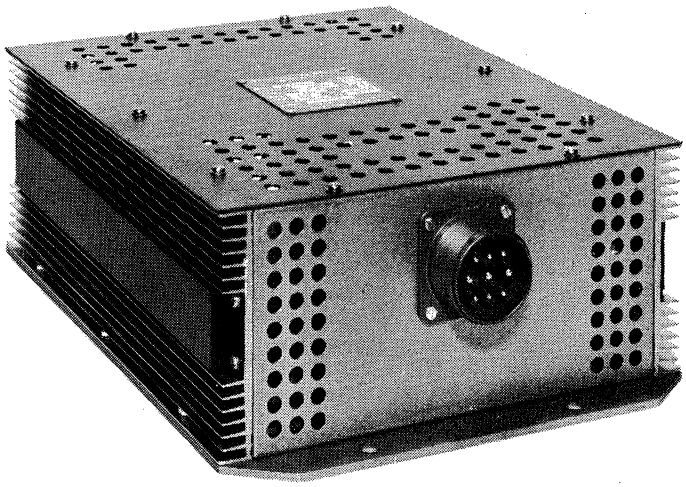
FLITE-TRONICS

60 Hz 400 Hz STATIC INVERTERS



Other Inverters Available:

- **Model PC-14 100 VA**
- **Model PC-14A 60 VA**
- **Model PC-14B 125 VA**
- **Model PC-15A 250 VA**
  Specifications same as PC-17A
- **12V to 24V Converters**
- **24V to 12V Converters**

For applications requiring greater than 750 VA of continuous power, the Flite-Tronics' Model PC-17A Inverter can be paralleled as necessary to double, triple, or quadruple the output power of a single unit. This is simply done by phase locking the oscillator in the PC-17A. Malfunction of a single unit when connected in this manner will not damage the other units in parallel. Each unit has its own overload protection. Each device is capable of self-preservation.

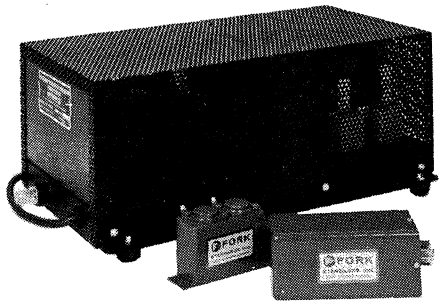
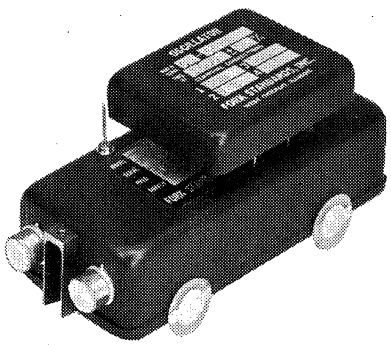
FORK STANDARDS





A precise frequency power inverter is a necessity whenever the power source must provide the frequency reference. Fork Standards' power sources use a precision crystal or tuning fork oscillator to control frequency, so frequency is independent of input or load.

The models described below are representative of Fork Standards' extensive experience in this field. A variety of models of the sizes shown or larger, both standard or custom designed, can be supplied to meet specific requirements.

YOUR SOURCE FOR INSTANT HERTZ!

LINEAR AMPLIFIER SERIES

Output: Sine wave, 0-125 VAC, 75 VA (standard), regulated

Frequency: 50, 60, or 400 Hz standard. 50-1000 Hz available. Also direct-coupled sine wave as low as 10 Hz at reduced voltage

Accuracy: .1 to .005%

Size: 14⅛" x 8¼" x 5½" High; weight: 22 lbs.

Price: (60 Hz output) From $480.00

SYNCHRONOUS MOTOR DRIVERS

Synchronous motors may be operated at speeds accurate to .001% (less than one second per day error) with Fork Standards compact power inverters. These DC powered units provide square wave AC outputs with frequency accuracies determined by their internal crystal or tuning fork references. A variety of voltages, powers and packages are available.

CLOCK MOTOR DRIVERS

3-5 VA, 115 V rms output. Both plug-in and stud mounted units with solder hooks can be provided.

MEDIUM POWER MOTOR DRIVERS

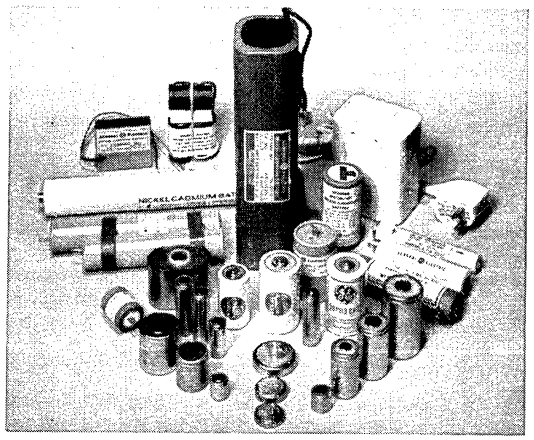
RECHARGEABLE NICKEL-CADMIUM BATTERIES

- Operate over a wide temperature range
- High discharge rate capability with constant voltage output
- Overcharge capability
- Long operating life
- High reliability
- Indefinite storage
- Meet severe environmental requirements
- Customized battery designs available

COMMERCIAL AND MILITARY APPLICATIONS



Typical sealed-cell battery designs.

SEALED CELLS

Sealed cylindrical cells and batteries are preferred for most applications requiring long, highly reliable life, high rates of discharge or charge current, complete portability, and safety. The micro-valve resealable pressure-relief safety vent allows higher charge currents, deeper discharges, and operation in higher ambient temperatures without damaging the cell or compromising product safety. The General Electric exclusive edge-weld construction on some types permits higher discharge currents without sacrifice in discharge voltage.

Sealed cells are available in three basic shapes: cylindrical, rectangular, and button. No maintenance is required and these cells will operate in any position. In addition, all cylindrical and rectangular cells in this classification feature a resealable vent mechanism that permits maximum cell life, even under infrequent abnormal operation.

Cylindrical and rectangular sealed cells provide maximum discharge rates and capacity. The special resealing vent mechanism on these cells provides added safety and reliability, making them especially suited for portable, cordless, rechargeable consumer products such as TV sets, radio receivers, and transceivers; appliances; and starting small gas engines. Available ratings run from 0.10 to 4.0 ampere-hours at the one-hour rate.

Button cells are particularly suited for portable radios, flashlights, photo flash equipment, burglar alarms, and other low-drain high-capacity applications. Available ratings run from 0.08 to 1.60 ampere-hours at the one-hour rate.

VENTED CELLS

Vented cells and batteries — Vented nickel-cadmium cells and batteries are built to achieve the high-rate discharge service associated with jet aircraft engine starting, diesel- and turbine-engine starting, fixed and portable power supplies. These cells provide outstanding performance where large peaks of power and fast recharging are required. In many applications, their performance permits a size reduction over lead-acid batteries and a reduction in maintenance.

Vented cells are available with capacities from 13.5 amp-hours to 170 amp-hours in both steel and nylon cases. Low-maintenance cells are available in the 25 and 40 amp-hour sizes.

A complete listing of models and sizes along with a description of battery operation and proper maintenance procedures will be found in a separate publication GET-3593, "Operating and Service Manual," available at no charge from General Electric Co., Aircraft Battery Sales and Service, P.O. Box 114, Gainesville, Fla. 32601.

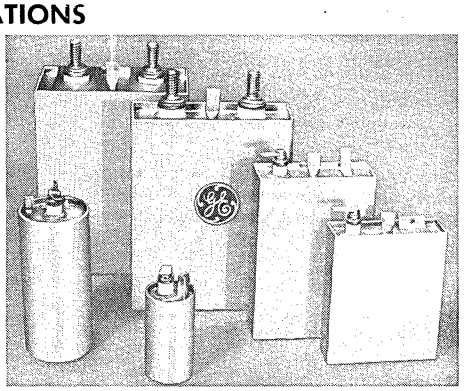
SPECIAL DESIGNS

All of these battery cell types can be customized, through use of special battery design and packaging techniques, to meet individual power and size requirements.

AEROSPACE APPLICATIONS

General Electric nickel-cadmium aerospace batteries are designed to operate for extended periods in an outer space environment. The battery cells employ a hermetic ceramic-to-metal seal (leakage rate less than 1×10^{-8} cc/second of helium per year) construction that effectively insulates the positive terminal or both terminals. The cells are also designed to withstand constant overcharging at specified rates.

Specialized cell and battery designs will be built to meet unusual requirements. This includes special cell terminal arrangements, deep drawn cases, cell case design, and third electrode control circuit to permit faster charging. Available ratings run from 0.75 to 100.0 ampere-hours at the one-hour rate.



Hermetically-sealed aerospace cells are available in stainless-steel cylindrical or rectangular case designs.

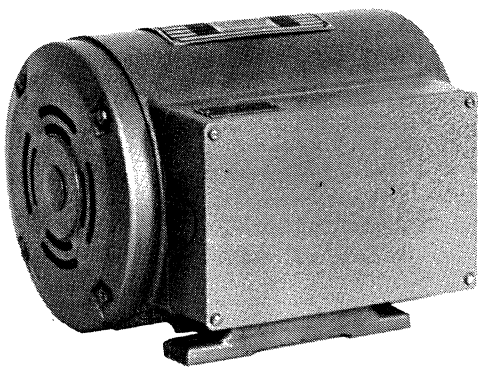
NOBRUSH® FREQUENCY

The heart of each "NoBrush" Frequency Converter is a "NoBrush" permanent magnet generator—a revolutionary development in its own right. The "NoBrush" permanent magnet generator features a cast aluminum rotor designed to give amazing voltage stability. It eliminates brushes, commutators, slip rings, resulting in absolute minimum maintenance. Elimination of excitation losses gives amazingly high efficiency, with consequent low heating. Other "NoBrush" advantages are excellent wave form, and immunity to damage by repeated overload or short circuit.

FREQUENCY CONVERTER SERIES 30 UNIT SHELL DESIGN FOR CONVERSION OF 60 TO 400 CYCLES



FEATURES:

Maximum Dependability
Cool Operation
Very Low Audible Noise
Extremely Low R.F. Noise (zero for most applications)
Compact Construction
Light Weight
High Overload Capacity
Minimum Maintenance
Withstands Short Circuit
Stable Output Voltage
Low Internal Impedance (favorable for pulse loads)
Operates in Adverse Environments

The "NoBrush" Unit Shell Frequency Converter was developed in response to the demand for an efficient, compact, dependable quiet unit, for powering electronic and other high frequency equipment. A "NoBrush" generator is mounted with a high quality induction motor within a single shell. Oversize pre-lubricated ball bearings, sealed for life, insure long term maintenance-free operation. Magnetism is permanently "locked in" at a high level. Problems of radio interference, sparking, fouling, etc., have been eliminated. Because of its simple design and rugged construction, the unit withstands extremes of mechanical and electrical operating conditions, resulting in continuous long-life service.

FUNCTION. The Series 30 Converter is a highly compact motor generator set for conversion of 60 cycle to 400 cycle power. CONSTRUCTION. Generator and motor stators contained within aluminum alloy unit shell. Generator and motor rotors pressed on unit shaft, with ball bearings at ends of shaft. Two-bearing construction is utilized, without any projecting shafts, couplings or belts. Single phase input models are provided with starting capacitor and relay, easily accessible in a generous-sized terminal box. APPLICATION. Wherever a dependable, trouble-free source of 400 cycle power within the range of 150 VA to 2.5 KVA is required, where 60 cycles (and in some cases, 50 cycles) is available for primary energy. SPECIFIC APPLICATIONS. As a source of high frequency power for electronic apparatus; for test and research work; for the servicing of aircraft electrical equipment; for portable radio and military electronic devices; for high frequency motors; for isolated power in computers.

SPECIFICATIONS: INPUT. Low-slip induction motors utilized for drive, available in single and three-phase models. Single phase units are reconnectable for 115 or 230 volts and are capacitor start, induction run. Three phase units normally supplied reconnectable for 208 or 220 or 440 volts. DUTY. Continuous. MOTOR SPEED. 3500 RPM for ratings up to 3/4 KVA. 1750 RPM for ratings from 1 KVA to 2 1/2 KVA. BEARING TYPE. Ball bearings, sealed, lubricated-for-life. ACCESS. In single phase models—to starting capacitor and relay by removal of external terminal box cover. OUTPUT VOLTAGE STABILITY. Within 1% for constant load and constant input frequency. EFFECT OF INPUT VOLTAGE CHANGE ON OUTPUT VOLTAGE. Output voltage will change less than 1% for input changes of plus or minus 10%, or for short period input disturbances as great as 30%. OUTPUT FREQUENCY. See Chart. OUTPUT FREQUENCY STABILITY. Within plus or minus 1/2% at constant load and constant input frequency. TEMPERATURE RISE. 40 degrees, C. (72 degrees F.) R. F. NOISE. Extremely low; may be considered zero for most applications. EXCITATION. Internal, permanent magnet. REGULATION. See typical curves. DIRECTION OF ROTATION. Operates equally well in clockwise or counterclockwise direction. WAVE FORM. No sharp peaks or spikes. Total harmonics, single or three phase, within 4% for ratings 1 KVA or over; 5%-8% for ratings under 1 KVA, depending on model. Improved wave form on special order. OPERATING POSITION. May be operated with shaft horizontal, vertical or at any angle. COOLING. By internally mounted fan. AUDIBLE NOISE. Approximately 70 db. (Measurement on "B" scale, at 3 feet distance from unit, in accordance with ASA Standard No. Z 24.7-1950.) AVAILABLE VARIATIONS. The following variations are available on special order, in most cases at only a modest addition in price. (Not all variations are available in all ratings.) • Re-lubricable bearings • Militarized construction • Other standard single or three phase input voltages • 50 cycle input • Synchronous motor drive • Other output frequencies—180,280,360,840 cycles • Other standard or non-standard output voltages • Reconnectable output windings for full power at either of two voltages • Low voltage taps • Auxiliary D.C. output at low or high voltage • Two phase output • Class "B" insulation for high ambient temperature operation • Carrying handles for easy portability • Screened openings for unfavorable environments.

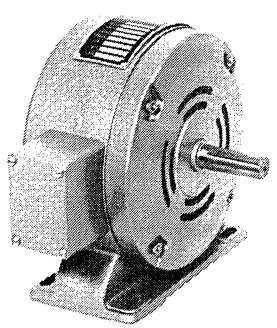
CONVERTERS AND GENERATORS

OTHER 400 CYCLE CONVERTERS & GENERATORS

"NoBrush" machines employ permanent magnet excitation—the oldest principle in generator construction—applied in the newest way. By modern principles of engineering design, performance and capabilities previously unheard of in rotating generators are made available—fitting the machine to applications where previously unsuitable. Outstanding advanatges exist over other methods of power generation and frequency conversion. Quality has been tested repeatedly in actual military and industrial applications, under most exacting conditions that would have disabled machines of other types.



ALTERNATORS

The original, revolutionary, "NoBrush" generator. Permanent magnets yield stability, reproducibility, ruggedness and virtually zero R.F. noise. Available in large variety of ratings, frequencies and voltages. Supplementary windings with rectifiers available for D.C. output.

How to select a Hewlett-Packard DC Power Supply for your application

DC Power Supplies — you might think of them in other terms, such as battery substitutes, rectifiers, AC-DC converters, power amplifiers, operational amplifiers or maybe even SCR's.

No matter what you call them, Hewlett-Packard offers more than 100 models of DC power supplies. These offer a wide range of voltages and currents, a sophisticated variety of control versatility and solid-state reliability. One of them may prove suitable for your application — whether it be for OEM use, a special system, the production table, or the research bench.

To this end, we offer the following guidelines for helping you select the right power supply. See the next three pages for a condensed listing of DC power supplies from Hewlett-Packard.

power supplies

Voltage Output: A power supply with a voltage rating about 10% higher than that required is recommended. This provides the necessary flexibility for testing and adjusting analytical and other systems.

Current Output: For optimum performance, the current rating of the selected power supply should equal or exceed the maximum instantaneous (not average) output demanded by the load. Built-in fast-acting protection circuits in Hewlett-Packard power supplies limit the output current to a preselected value; this protects both the power supply and the load from damage.

Output Mode: Most HP power supplies are designed to provide either a constant voltage or a constant current output. However, many HP power supplies are designed to operate in either mode and to automatically switch (cross over) from one mode to the other at any preselected point in the output range. If flexibility in operating mode is desired, these versatile HP power supplies are recommended.

Specifications: Most applications will call for well regulated power supplies. These fluctuate less than 0.01% for a maximum change in input AC line voltage or output load resistance. With no change in load or line conditions, a well regulated supply will drift less than 0.03% in eight hours and experience an output change of less than 0.01%/°C change in room temperature. Ripple and noise are functions of internal filtering and isolation; 200uv RMS is typical of well regulated HP supplies (for a 24V output, this is less than 10 parts per million). Performance specifications a factor of 10 times better are available from more precise units while moderate regulation of .5 to .1% is typical of units with output ratings above 2 kW.

Powertron SOLID STATE AC POWER SUPPLIES

The Powertron AC Power Supplies provide stable, low distortion, AC power at frequencies within the audio frequency spectrum. These highly reliable and versatile power sources find wide application in calibration and test stations, motor drives, gyro wheel supplies, laboratory use, military component testing, and operating foreign equipment. These supplies may be used whenever it is necessary to provide AC power at a frequency not available from the power lines.

The various supplies feature all solid state construction, wide operating frequency range, low distortion, and a wide variety of output voltages and impedances. The units are designed to be used in modular form so that a single unit can provide single phase output, and two or three units may be used to provide two phase or three phase outputs respectively.

The ordering designations listed below are for convenience of specifying the components required for various power supply configurations. To select an appropriate unit for your requirements first determine which category, 1-phase, 2-phase, or 3-phase, is most suitable to your intended load. Then use the ordering designation adjacent to the required output power within that category. For the complete ordering designation replace the asterisk with the ordering code letters of the plug-in-oscillator listed

The Intronics standard line of modular power supplies provides the designer with a rugged, low cost solution to system power supply requirements. A wide range of supplies is available for fast delivery to meet the commonly used voltage and current requirements. These supplies are rugged, epoxy encapsulated units requiring no adjustments . . . just plug in and use. They feature the best possible characteristics designed-in for easy use and trouble-free operation: preset voltages to ±1%, output short circuit protection, low ripple, wide operating temperature range with no derating, 50 to 400 Hz operation, and 50 Meg isolation. These modular supplies are ideal for powering operational amplifiers and other analog function modules in addition to IC logic circuitry. They can be either soldered directly to circuit boards or plugged into a low cost mating socket. In addition, for more secure mounting, threaded 4-40 inserts are available on the bottom of the modules.

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem,** the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

HOW TO USE THIS CATALOG

Kepco's Power Supply catalog is organized into product groups for ready access. The groups are classified by a shared major characteristic.

Section 1: Modules ..... Page 738
Section 2: High Speed (fast programming) ..... Page 747
Section 3: High Voltage (200V and over) ..... Page 750
Section 4: General Purpose ..... Page 754
Section 5: Special Purpose (strain gauge, I-C, etc.) .. Page 757
Section 6: Programmers (interfaces, digital systems) . Page 762
Section 7: Accessories (overvoltage crowbars) ..... Page 766
Section 8: Hardware (rack adapters) ..... Page 767

Of course, a power supply might have several important classifications, so be sure to check the cross reference at the beginning of each section to find other listings which share the desired characteristic. For example: the *High Speed* Section contains data on Kepco's BOP and OPS designs and cross references data on the BHK, CC, JQE–HS and PAX–HS cataloged elsewhere.

Kepco Power Supplies are manufactured in DESIGN GROUPS, identified by a letter-group prefix. All models within a group share major electrical and physcial characteristics. They are usually produced in a variety of volt/ampere combinations generally identified by the model numbers which give the maximum voltage rating and current rating in sequence. Example: Model ABC 40–0.5, a model in the ABC Design Group, rated 0–40V, 0–0.5A. Optional features may be identified by the use of suffix letters. Example: ABC 40–0.5M – metered model.

CCP
current stabilized modular
POWER SUPPLIES

The Kepco CCP modules are current controllers with a built-in current sensing resistor and adjustable voltage limiter. They employ a monolithic I-C amplifier driving a self-cooled NPN series transistor regulator. Capacitorless output filtering insures rapid recovery from switching or load transients. The output current ranges from true zero to 100%, linearly controlled by an external rheostat.

**External sensing, using a 1V sample. Effects are measured at rated sample voltage with 20 PPM external current feedback control.

***Offsets and the reference contribute to output change ΔE_O, by the equation $\Delta E_O = \pm\Delta E_{ref}(R_f/R_i) \pm\Delta E_{io}(1+R_f/R_i) \pm\Delta I_{io}(R_f)$ where R_f is the feedback resistor and R_i is the input resistor from the signal reference. Use the offsets to calculate output variations when external input/feedback elements are substituted for the internal reference and voltage control in special applications.

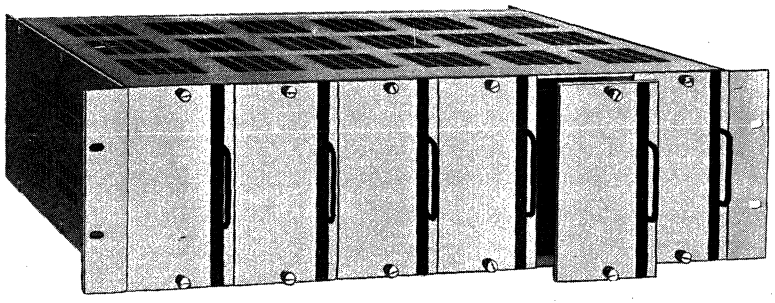
KEPCO PAX MODULAR POWER SUPPLIES



6 uncased modules mounted in RA 22-6 housing using BPA-22 slide adapters

PAX modules are low cost, single-amplifier power supplies that can be used with voltage or current feedback. The HS models (high speed) are especially recommended for current control because of their fast-recovery characteristics. In the PAX design, a convection-cooled PNP series pass transistor is used, the negative output terminal is common to the signal input. The PAX models are thus the signal-complement of the PCX and OPS designs.

**External sensing, using a 1V sample. Effects are measured at rated sample voltage with 20 PPM external current feedback control.

***Offsets and the reference contribute to output change ΔE_o, by the equation $\Delta E_o = \pm\Delta E_{ref}(R_f/R_i) \pm\Delta E_{io}(1+R_f/R_i) \pm\Delta I_{io}(R_f)$ where R_f is the feedback resistor and R_i is the input resistor from the signal reference. Use the offsets to calculate output variations when external input/feedback elements are substituted for the internal reference and voltage control in special applications.

INPUT: 105-125V a-c or 210-250V a-c (selected) 50-440 Hz, 1Ø.

TEMPERATURE, AMBIENT OPERATING: Cased: −20°C to +65°C. Uncased: −20°C to +71°C. (no derating)

TEMPERATURE: STORAGE: −40°C to +85°C.

ISOLATION: The output terminals are isolated from the grounded case. A maximum of 500 volts (d-c or peak) can be connected between either output terminal and the case.

PROGRAMMING: PCX is fully programmable by resistance or external voltage signals. Control current is ≅1 mA for 1000 ohms/V (option "–R" provides a calibration control). The positive terminal is common. For operational (amplifier) control, an offset voltage nulling control is available, see Option "–E." Suffix "MAT" models have 10-turn voltage control built-in. Resolution: 0.05%.

OPEN LOOP d-c GAIN: $>0.5\times10^6$ volts per volt.

VOLTAGE RECOVERY (for step load current): <50 μseconds for recovery to within 0.005% or 2 mV of setting.

CURRENT LIMITING: Adjustable from 10% to 105% of the rated full current.

REMOTE ERROR SENSING: Compensates up to 0.5V drop per output lead.

OVERSHOOT: (Turn-on/off): None above 25% voltage setting; negligible below 25% when preloaded to 10% minimum.

SERIES/PARALLEL: Series operation to rated isolation; also master/slave capability. Current limiting design permits self-determined parallel load sharing.

COOLING: Convection.

TERMINALS: All input, output and control connections are made via a multi-terminal barrier strip and printed circuit connector.

DIMENSIONS: See dimensional listings on Page 771.

FINISH: Blue anodized aluminum.

CASES/MOUNTING: Model number without suffix specifies an uncased open model. Add suffix "C" and $12.00 to price for wraparound case — or order Case CA-1 separately. Cased models can be rack mounted on adapters RA 12-1, RA 13-4 or RA 11-6. Uncased models can be used with BPA-22 slide adapter for plug-in mounting. These fit interchangeably with metered "MAT" – option models in Cases CA-3, CA-4, CA-5 or RA 22-6. *See Hardware section.*

OPTIONS: (add suffix to the model number).

"–MAT" This option provides for a fully metered plug-in package with separate voltmeter and ammeter and a 10-turn output voltage control. Furnished *uncased* for mounting in single unit case CA-3, dual case CA-4 or triple case CA-5. May be rack mounted in six-unit housing Model RA-22-6, see Hardware Section. See table for specifications and prices.

"–R" CONTROL CURRENT ADJUSTMENT: ± 10% trimmer provides for programming calibration. Add $10.00 to price.

"–T" LOWER TEMPERATURE COEFFICIENT: 0.005% per °C in voltage mode, 0.01% per °C in current mode. Add $30.00 to price.

"–E" OFFSET VOLTAGE NULLING: For operational programming. Zero the fixed part of the control amplifier's voltage offset. Add $10.00 to price.

Data and prices subject to change without notice.

All terms used in the specifications are defined in the Kepco Glossary.

MODULAR

POWER SUPPLIES

The Kepco PRM voltage regulated modules are simple, reliable, efficient, fixed output sources. The design is based on a ferroresonant power transformer called Flux-O-Tran® which provides both regulating and overload current limiting. The extra-filtered models (suffix F) have a Pi section LC filter, reducing their ripple to about a tenth that of the single section capacitor-filtered models. The *dual* output models have two independent d-c circuits that may be used in series or in parallel or separately. Size "D" models feature an adjustable output tap.

This tabluation specifies the limit of change in the regulated output for defined variations in the major influences. To obtain a realistic appraisal of the behaviour in your environment, multiply each influence by its probable range of variations and sum the pertinent effects.

† The extra filter stage introduces an additional 2% drop. A 10% reduction in load current will compensate for this loss.

†† Interaction between sections of the dual supply produce an extra –2% change when the other section is loaded from zero to maximum.

‡ For ±15V a-c source variation with loads between 25–100%. For loads below 25% the source effect is ±1.5%.

▼For ±15V a-c source variations with loads between 50–100%. For loads below 50% the source effect is ±1.5%.

INPUT: 115V a-c ±15V a-c, 60 Hz ±5% single phase.

Overseas Models: For 50 Hz ±5%, specify suffix "–50." Inputs (selectable) are: 104 ±13.5V a-c, 115 ±15V a-c, 208 ±27V a-c or 230 ±30V a-c. Output current rating is decreased 20% in the 50 Hz version. Add $15.00 to the unit price.

NOTE: Input frequency variations produce an approximately equal percentage output voltage change.

TEMPERATURE, AMBIENT OPERATING: –20°C to +55°C.

TEMPERATURE, STORAGE: –40°C to +85°C.

COOLING: Convection.

OUTPUT IMPEDANCE: 1 kHz to 10 kHz: 0.05 ohms, 10 kHz to 100 kHz: 0.05 ohms + 0.5 microhenries. Below 1000 Hz, the impedance is a function of load current and may be derived from the slope of the load regulation curve ΔE/ΔI.

VOLTAGE RECOVERY (step load current, 50–100%): <400 ms.

OVERLOAD PROTECTION: Current limiting transformer restricts short circuit current to safe value. A thermal circuit breaker is employed in *dual* models.

ISOLATION: The output terminals are isolated from the grounded case. A maximum of 600 volts (d-c or peak) can be connected between either output terminal and the case (or between the outputs of dual models.)

SERIES/PARALLEL OPERATION: Identical models, or halves of a dual supply can be paralleled for approximately double current (allow for 10% imbalance). Series operation to rated isolation.

ACCESSORIES: Various rack adapters available, see hardware page. *Cases:* Size A uses CA-200; Size C uses CA-300. Sizes B and D have non-removable integral enclosures. To order a fully cased model in sizes A and C, add a suffix letter "C" to the model number.

FINISH: *Cases:* royal blue.

Typical "BTA" Panel Plug-in Model

Cased Module

The Kepco Operational Power Supply is a unique instrument; a combination self-powered operational power amplifier and d-c power supply. The OPS group is suitable for a wide variety of signal processing chores: scaling, summing, integrating and impedance transformation. All models incorporate a linear I-C input amplifier. The "B" models are in modular form for OEM's; the "BTA versions are plug-in modules which offer a 10-terminal patch panel for bench-type operational manipulations. Their fast output slewing enables the OPS models to be fast-recovery, programmable, current controllers or audio spectrum voltage amplifiers.

This tabulation specifies the limit of change in the amplifier offsets for defined variations in the major influences. To obtain a realistic appraisal of the behaviour in your environment, multiply each influence by its probable range of variation and sum the pertinent effects.

The ABC group of bench-style programmable voltage regulators span a wide range of voltages. The transistor group covers 0–2V to 0–100V; the hybrid group 0–200V to 0–2500V. Hybrid models employ a high voltage vacuum tube series regulator, convection cooled, driven by a high gain transistor amplifier. The 0–200 and 0–425 volt models employ a continuous 10-turn wirewound, 20 PPM TC voltage control. The 0–1000 volt, 0–1500 volt and 0–2500 volt models employ a 10-step voltage selector with 10-turn vernier. They may be programmed, however, continuously from zero to their rated voltage.

Voltage feedback is by means of a 5-position range switch and 10-turn, 20 PPM TC wire-wound vernier control with remote programming within the span of any one range (to zero with derating). Current may be regulated with external sensing and feedback using the rating chart to determine the allowable compliance range.

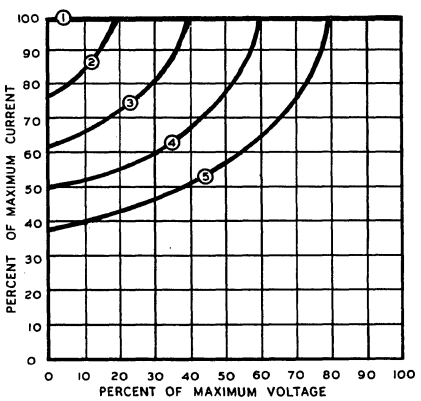
When operating outside the selected range, either by remote programming, or as the compliance voltage in current mode, use the graph to determine the maximum current that can be drawn at reduced voltage.



RATING CURVES

Curves represent the volt-ampere rating for range switch positions 1–5. To use, determine which position covers the desired voltage. Read the maximum current for each voltage on the left scale.

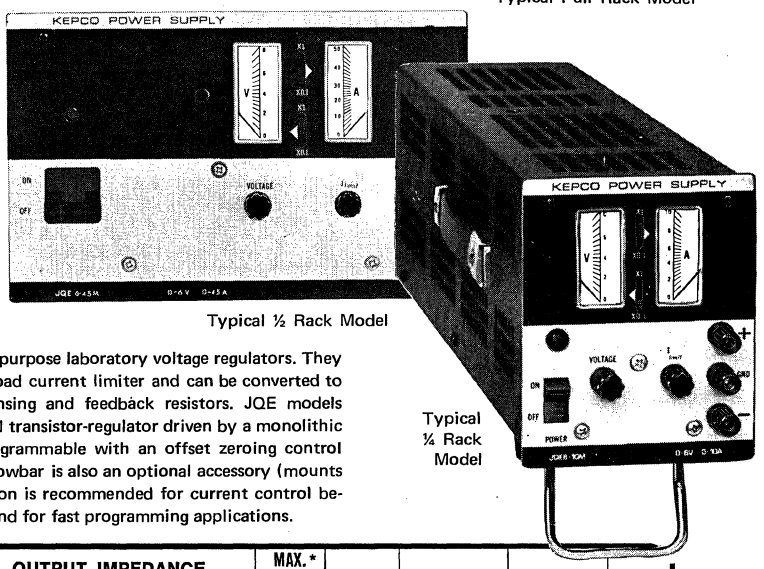
KEPCO™ JQE *COMPACT* POWER SUPPLIES



Typical ½ Rack Model

Typical ¼ Rack Model

JQE power supplies are compact general-purpose laboratory voltage regulators. They are equipped with a panel-adjusted overload current limiter and can be converted to current regulation by using external sensing and feedback resistors. JQE models feature a linear full-dissipation series NPN transistor-regulator driven by a monolithic linear I-C amplifier. Output is fully programmable with an offset zeroing control available as an option. An overvoltage crowbar is also an optional accessory (mounts internally). The JQE-HS high-speed option is recommended for current control because of its fast-recovery characteristics, and for fast programming applications.

CC

CONSTANT CURRENT

POWER SUPPLIES

The CC plug-in modules are current controllers with built-in dual-range, current-sensing resistors and 10-turn control. They employ Kepco's monolithic linear I-C amplifier driving a self-cooled NPN series transistor-regulator. Capacitorless output filtering ensures rapid recovery from switching or load transients. Output current ranges from true zero (no minimum) to the selected range (10% or 100% of the current rating) with 10-turn resolution. Metering is isolated by means of an I-C voltage follower.

Typical ½ Rack Model

CPS Power Supplies are especially designed for driving digital I-C's. They feature an integral overvoltage crowbar and a linear full-dissipation series NPN transistor-regulator driven by a monolithic linear amplifier. On/off switching and crowbar reset is accomplished by a panel-mounted circuit breaker. The metered models feature panel-mounted, 10-turn voltage controls and dual meters. The CPS Power Supplies are also available unmetered, in modular form for OEM's with controls recessed.

**External sensing, using a 1V sample. Effects are measured at rated sample voltage with 20 PPM external current feedback control.
***Offsets and the reference contribute to output change ΔE_o, by the equation $\Delta E_o = \pm\Delta E_{ref}(R_f/R_i) \pm\Delta E_{io}(1+R_f/R_i) \pm\Delta I_{io}(R_f)$ where R_f is the feedback resistor and R_i is the input resistor from the signal reference. Use the offsets to calculate output variations when external input/feedback elements are substituted for the internal reference and voltage control in special applications.

8 uncased KG Modules in multiunit Housing RA 19–8

The KG isolated module is designed for driving balanced electronic circuits and bridges - often used with electromechanical transducers. The KG module offers minimal common mode line-coupled current, achieved by stringent isolation of the power transformer and line-related components, and nonmetallic, low-capacitance mounting. The modules are designed for plug-in mounting 8-abreast in a 19-inch rack or in an individual plug-in case.

The PVS Precision Voltage Source features an extremely low drift linear amplifier driving a self-cooled NPN power transistor stage. Voltage control is by means of digitally selected (1–2–4–8 BCD) precision –low TC, high stability feedback resistors with a 3-decade oven-controlled reference. Output is displayed on a 4½ digit readout with a built-in error-detecting system to prevent false indication. Output current is metered and the limit is adjustable. A remote digital programming connector is fitted to the voltage control (BCD switch closures). Model with suffix "G" omits the remote digital control feature. Model FG 100 — Price: $616.00 — Shp. Wgt. 16 lbs.

Model FG-100 is a precision, slow speed, triangular waveform generator capable of generating any repetitive ramp function. Separately adjustable, high and low limits, are provided which periodically reverse the direction of the integration. The rising rate and falling rate are separately adjustable or can be controlled symmetrically with a single control.

OUTPUTS: All outputs available simultaneously.
#1 — 0–20V d-c, 0–20 ma.
#2 — 0–10 ma to program 100 ohm/volt power supply.
#3 — 0–1 ma to program 1000 ohm/volt power supply.

INPUT: 105–125V or 210–250V a-c, 50–440 Hz.

TIMING: 4 ranges: 0.1V/sec., 1.0V/sec., 10V/sec., 100V/sec. Rising and falling slopes continuously adjustable between ranges either separately or symmetrically. For outputs #2 and #3, divide the above timing by 2000 and 20,000 respectively to obtain milliamperes per second.

LIMITS: Separately adjustable high limit and low limit permits operation between any two pre-set voltages or currents.

REVERSING SWITCHES: Programming direction is automatically reversed at the high and low limits. In addition, a pair of push buttons are provided which permit the direction to be reversed at any point in the operating span. A pair of directional lamps are provided to show the direction of the ramp.

METER: 2½" edgewise meter monitors output in volts (0–20V a-c) and in percent of maximum output, 0–100%.

PROGRAMMING: Model FG–100 may be used by itself to generate a wide variety of very low speed triangular or sawtooth functions, or it can be used directly with any programmable d-c power supply. When connected to a programmable power supply, the Model FG-100 Function Generator programs the power supply throughout all or part of its rated voltage or current range as set by the power supply's controls and the function generator's limit settings.

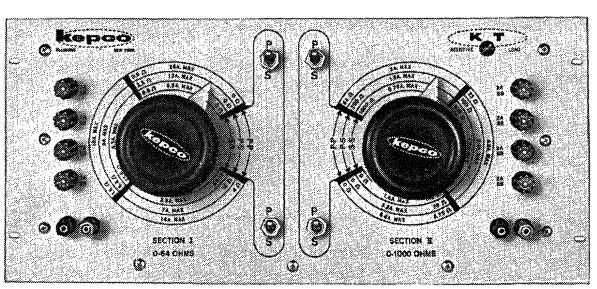
NOTE: function speed is converted to programming speed by multiplying the driving current rate (ma/sec.) by the resistance setting of the voltage control of the power supply being programmed. This gives the programming speed of the power supply's output in volts per second.

REMOTE CONTROLS: Timing and limit setting controls are brought to a multi-terminal barrier strip at the rear of the unit for remote operation. A sync output is also provided as is provision for remote directional signals.

DIMENSIONS: 4¼"H x 8$\frac{5}{32}$"W x 13⅜"D

MOUNTING: Mount single unit in rack adapter RA-5, two abreast in rack adapter RA-4. *See Hardware Section.*

KEPCO VARIABLE RESISTIVE LOAD



Model KT 6212 — Price: $619.00 — Shp. Wgt. 47 lbs.

The Model KT 6212 is a multiganged, eight-section group of dual-wound power rheostats used in the testing of regulated power supplies.

Model KT 6212 consists of two independent gangs of four rheostats apiece, 0-64 ohms and 0-1000 ohms. The rheostats can be switched for parallel, series parallel and series operation. Each rheostat has heavy and light windings so that the maximum load current changes at approximately each third rotation point around the dial.

CONTROLS:
Switches select series and parallel combinations of the four ganged rheostats with the corresponding resistance and current rating designated by concentric bands.

Each band defines the resistance range for its particular connection with zero ohms (maximum current) in the clockwise position. The bands are divided into three sections that correspond to the position of the heavy and light windings, respectively. The maximum current in each section is shown on the corresponding portion of the band.

FUSING:
Each rheostat in the 0-64 ohm gang is fused at 7 amperes. Each rheostat of the 0-1000 ohm gang is fused for 2 amperes.

TERMINALS:
A pair of 5-way binding posts is provided at each gang for connection to the power source under test. These connections are duplicated at the rear.

EXTERNAL POWER REQUIREMENTS:
None. The Model KT 6212 is a passive device.

DIMENSIONS:
8¾"H x 19"W x 13⅜"D. The Model KT 6212 resistive load is designed for mounting in standard 19" equipment racks.

Model NTC–200 will provide the programming interface for power supplies up to 200 volts, including models in the CPS, JQE, OPS, PAT, and PCX Design Groups.

Model NTC–2000 will provide the programming interface for power supplies up to 2000 volts, including models in the ABC (Hybrid),HB,BHK,and OPS(Hybrid) Design Groups.

KEPCO NTC PROGRAMMING INTERFACE

The Kepco NTC is a power supply–to programmer interface that provides a convenient solution to the problem of mixed grounds with *common–positive* d-c power supplies. The NTC is an operational inverting amplifier which boosts a programming signal to the desired *voltage* level, then couples this signal to the noninverting voltage repeater (feedback) terminals of the power supply. By this means, the *negative* output terminal of the power supply is made electrically common to the signal source.

MODEL	d-c OUTPUT RANGE VOLTS	mA	RIPPLE rms	SLEWING RATE	MAX. INPUT AMPS at 125 V a-c	PRICE	SHIP. WGT. (lbs.)
NTC–200	0–200	0–10	0.01%*	1V/μsec.	0.25	$190.00	10
NTC–2000	0–2000	0–1	0.01%*	3V/μsec.	0.3	325.00	15

**or 5 mV, whichever is greater.*

This tabulation specifies the limit of change in the regulated output for defined variations in the major influences. To obtain a realistic appraisal of the behaviour in your environment, multiply each influence by its probable range of variation and sum the pertinent effects.

SPECIFICATION	VOLTAGE AMPLIFIER OFFSETS ΔE_{io}	ΔI_{io}	REFERENCE (±6.2V)
SOURCE: 105–125/210–250V a-c	<100 μV	<10 nA	0.0005%
LOAD: No load – full load	<1 mV	<10 nA	——
TIME: 8-hours [drift]	<20 μV	<5 nA	0.005%
TEMPERATURE: Per °C	<20 μV	<5 nA	0.005%

Offsets and the reference contribute to output change ΔE_O, by the equation $\Delta E_O = \pm \Delta E_{ref}(R_f/R_i) \pm \Delta E_{io}(1+R_f/R_i) \pm \Delta I_{io}(R_f)$ where R_f is the feedback resistor and R_i is the input resistor from the signal reference. Use the offsets to calculate output variations when external input/feedback elements are substituted for the internal reference and voltage control in special applications.

SIGNAL INPUT: 0–1 milliampere, current driven into zero ohms. A voltage signal is connected to the NTC through a coupling resistance such that the peak input current is 1 milliampere. [Example: 0–10V signal, 10 K ohm input resistance.]

SIGNAL OUTPUT: 0–100% E_o maximum at rated current. The output of the NTC may be used directly to drive loads whose current requirements are small and can be accommodated by the respective ratings. The intended application, however, is for the NTC output to drive the voltage repeater [feedback] terminals of a suitable power supply.

OPEN LOOP d-c GAIN: $>0.5 \times 10^6$ volts per volt.

SINUSOIDAL FREQUENCY RESPONSE:

$$f_{max.} = \frac{\text{Slew Rate}}{\pi E_{pp}}$$

[E_{pp} is the peak-to-peak voltage excursion.]

MAXIMUM CAPACITIVE LOADING: 0.001 microfarad. Capacitance in excess of this value will slow the response, cause peaking, and reduce the stability margin. An adjustable network is provided to compensate for a small range of reactance.

REFERENCES: Two +6.2 volts [nominal] and -6.2 volts [nominal] at 1 milliampere maximum.

POWER INPUT: 105–125V a-c or 210–250V a-c [selected], 50–65 Hz, single phase.

TEMPERATURE, AMBIENT OPERATING: -20°C to +65°C.

TEMPERATURE, STORAGE: -40°C to +85°C.

COOLING: Convection.

ISOLATION: The output terminals are isolated from the grounded case. A maximum of 500 volts for Model NTC–200, or 1000 volts for Model NTC–2000 (d-c or peak) can be connected between either output terminal and the case.

TERMINALS: Front panel binding posts and rear barrier-strip duplicate all functions.

DIMENSIONS: NTC–200: 5 7/32" x 4 5/32" x 17 3/8"
NTC–2000: 5 7/32" x 8 5/32" x 12 7/8"

DPD—6	3 digit	0—10.00V	DPR—3	Cable B
DPD—7	3 digit	Current	DPR—3	Cable B

FUNCTION:
To control the output level (voltage or current) of a d-c Power Supply by means of digitally encoded commands.

OUTPUT RANGE: Each DPD will program 10% overrange and when using the voltage control board has three selectable decimal levels. The largest is shown in the chart; e.g., Model DPD—1, a 4 digit overranging instrument will program: 0—10.999 volts, 0—109.99 volts and 0—1099.9 volts. The DPD—7, a three-digit instrument for the control of current has two selectable decimal levels. A current code board, compatible with the *current rating* of the power supply being controlled, is needed with the DPD—7. Specify the *current code board* when ordering by appending a suffix number to the model equal to the *ampere* rating of the supply being controlled. Specify Model DPD—7—22A for an instrument to control a 22 ampere power supply. The *current code board* in Model DPD—7 causes the programmed current to correspond to the numerical display of the companion DPR—3 Register.

DESCRIPTION: The DPD's use transistor-driven reed relays to actuate resistors in a 1—2—4—8 BCD code. The input is parallel (RTL) logic levels or switch closures; the output a four-wire resistance and control current command capable of programming any Kepco Operationally Programmable Power Supplies. The DPD's may be driven by the suitable companion DPR which provides serial-parallel conversion, data storage and display.

TIMING: Commands to the DPD are sequenced: hold—execute —program, requiring a 10 millisecond sequence time. This sequencing is provided by the DPR when used together.

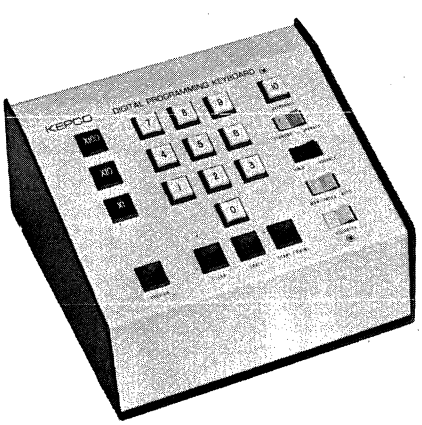
INPUT: logic "0" is 0 to 0.3V d-c
logic "1" is 1 to 3V d-c
input impedance: 3K ohms

POWER REQUIREMENTS:
115V ±10V a-c or 230V ±20V a-c, 50-440 Hz single phase

DIMENSIONS: 5 7/32"H x 8 11/32"W x 12 7/8"D
Rack adapter (Model RA-24) is available)

DIGITAL PROGRAMMING KEYBOARD

Model DPK-1



FUNCTION:
To control the output of a regulated d-c Power Supply with an adding machine keyboard, through a DPR logic and DPD analog converter. DPK-1 is a manual input — in serial form — for the DPR registers.

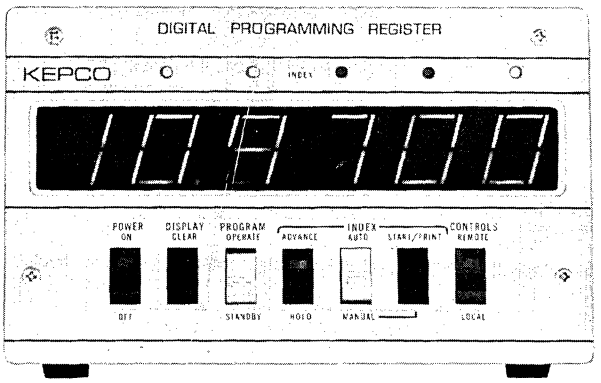
DESCRIPTION:
The DPK-1 uses SPDT keys to generate decimal code and register control signals, which are shaped and processed for delivery to the DPR storage register. Model DPK-1 will program registers DPR-3, DPR-4 and DPR-5

COMMANDS:
10 digit decimal signals, 3 ranges, Space, Clear, Start/Print, Index, Hold/Advance, Standby/Operate, Preview, Polarity.

POWER: Supplied from DPR.

DIMENSIONS: 4 5/16"H x 8 11/32"W x 7 5/8"D
Rack adapter (Model RA 29-1) available.

DIGITAL PROGRAMMING REGISTER



Model DPR-5

MODEL	NUMBER OF DISPLAY REGISTERS
DPR-3	3 + Overrange
DPR-4	4 + Overrange
DPR-5	5 + Overrange

FUNCTION: The registers accept inputs of binary coded decimal programming signals, display and store them; and provide a parallel output signal to a DPD decade for the purpose of controlling a power supply. The models DPR are used for the storage and display of digital input information within a complete Digital Programming System.

INPUTS: Inputs may be provided by a Model DPK-1 Keyboard or other inputs, such as magnetic or punched tape or code generators.

OUTPUTS: The DPR's provide parallel output data on 21 lines for presentation to a programming decade DPD-1 — DPD-7. Simultaneously, a separate output is provided at the front panel consisting of a segmented numeric display, decimal point and index indicator. The index indentifies the register digit next in line to receive a command.

The DPR provides the logical sequencing of its companion DPD for each command change. At the instant of switching, timing signals from the DPR instruct the DPD to "hold" while new command levels are established. This sequenced action prevents discontinuities in the output.

POWER REQUIREMENTS: 115V a-c ±10V a-c or 230V a-c ±20V a-c, 50-440 Hz single phase.

DIMENSIONS: 5 7/32"H x 8 11/32"W x 17 3/8"D. Rack mount with adapter RA-24.

CABLES: There are two types of cabling used to interconnect Register, Decade and Keyboard. Types A and B are available in 3 feet and 10 feet lengths. The Type A Cable is used to connect a Model DPK-1 to any of the three Registers DPR-3, 4 and 5. Between the Registers and the various Decades, use the cable type listed in table. Use a 4-wire shielded cable (not supplied) between Decade (DPD) and the power supply it is to program.

Model VP–PX

The Kepco VIP (stand alone, rack mounted) and VP (bolt-on) protectors are independent voltage monitors complete with their own power supply, reference, comparator and SCR crowbar. A voltage excursion above the static trigger level (or below, in the case of VIP-3, the undervoltage protector) initiates crowbar conduction to clamp the supply terminals. Simultaneously, a power interlock relay (or connection to the power supply's circuit breaker) trips to remove the primary a-c power. Re-set is automatically accomplished when the a-c power is restored.

SENSITIVITY: **VIP Models:** 1% of the operating voltage or 0.1V
VP Model: 5% of the operating voltage or 0.25 volts, whichever is greater.
VIP-1 &-3 Current Sensitivity: 5% of the operating current producing a 1 volt drop across an external sensing resistor.

TEMPERATURE COEFFICIENT: 0.1% or 0.1V (whichever is greater) per °C.

REMOTE ERROR SENSING: Compensates for up to 1V per output lead.

DIMENSIONS: See outline drawings, this section.

FINISH: VIP Panels, light gray, color 26440, per Fed. Std. 595.

OPTIONS (Tracking Mode, VIP Models): The VIP may be interconnected with the voltage control of the power supply that it monitors to sense a voltage differential between the output of the supply and the programmed voltage. For details, please consult the factory.

KEPCO
HARDWARE AND MOUNTING EQUIPMENT

6-in-a-RACK MOUNTING SYSTEM

The Kepco 6-in-a-rack concept is designed to solve the problem of multiple output, multiple function power supplies. There are eighteen different models available in three styles (PCX—voltage regulators, CC—current regulators and OPS—operational power supplies). Each style is available in the same six volt/ampere combinations: 0—7V @ 2A, 0—15V @ 1.5A, 0—21V @ 1A, 0—40V @ 0.5A, 0—72V @ 0.3A and 0—100V @ 0.2A. Additionally, the PCX models (voltage regulators) and the OPS models (operational power supplies) are made in two mechanical formats. They are available as modules with or without cases or can be ordered in a "laboratory format" with operating panels complete with controls, terminals and (for the PCX) meters. The CC models (current controllers) are available only in the laboratory format with a 10-turn current control, two meters, on-off switch, pilot light, etc. If you want a modular current controller, you would use the OPS module—with current feedback.

The models in laboratory format are identified by a special suffix. For the voltage regulators, the suffix is "MAT," and the model number would read (for example) PCX 21-1MAT. For the operational power supplies, the suffix is "TA," and the model number would read OPS 21—1BTA. The letter "B" in that suffix is part of the regular (module-style) model number, OPS 21—1B.

Four different mounting assemblies are offered for the three laboratory-style groups. Case CA—3 mounts a single unit with built-in printed circuit-to-barrier strip interface, line cord, handle and feet for bench mounting.

Case CA—4 mounts any two units, identical or dissimilar with built-in printed circuit-to-barrier strip interfaces for both models. It contains a single line cord, handle and bench mounting feet.

Case CA—5 mounts any three units, mixed or matched. It contains three printed circuit-to-barrier strip interfaces, line cord, handle and feet.

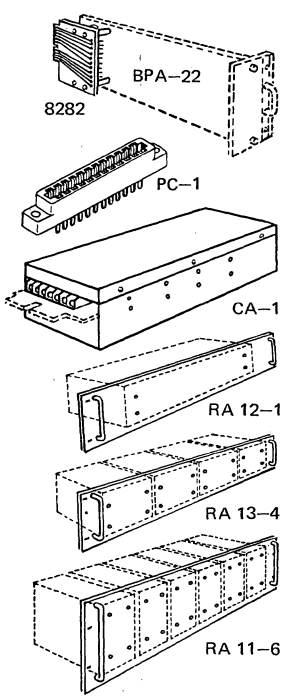
RA 22—6 is a 19" wide housing which fits in 5¼" of standard rack space and accepts any six units. RA 22—6 does not include any PC-to-barrier strip interfaces. Order these separately as Model PC—2. You'll want one Model PC—2 for each unit mounted in the RA 22—6. A line cord is supplied which must be bussed to each active PC—2.

In all of these housings, the power supplies mount on rails so that they will slide in and out freely. A set of coding pins are provided so that you may uniquely encode each slot for a particular supply.

The modular style of the PCX and the OPS models as well as Kepco's PAX model can be plugged into the various housings by mounting an uncased module onto a Model BPA—22 slide adapter.

Various filler panels are available to close off unused slots in any of the housings.

A simpler rack mounting adapter is available for the cased modules: PCX, OPS and the Kepco PAX models. These are Models RA 12—1 (single), RA 13—4 (4 units) and RA 11—6 (6 units). Mount the cased model by machine screws to these adapters and make input-output connection by means of a PC connector Model PC—1.



HARDWARE FOR PLUG-IN MODELS OPS-BTA, PCX-MAT AND CC POWER SUPPLIES.
OPS-B, PAX and PCX models can also be mounted using BPA—22 Adapter.

HIGH VOLTAGE D.C. POWER PACKS

These units are high voltage sections of standard power supplies minus meters and controls and contain the basic components described for standard power supplies — filter system, fail-safe mechanism, surge resistor, meter multiplier, primary gaps, etc.

HIGH VOLTAGE HARDWARE AND ACCESSORIES

MULTIPLIERS AND DIVIDERS. High voltage resistance strings, accurate to 0.15% or better with division ratios which may be specified. Stability is 25 PPM/°C; current drain 1 ma. Accuracy traceable to NBS standards as an option.

ELECTRONIC CROWBAR designed to protect Klystron or other sensitive loads from damage by discharge of power supply energy can be manufactured into your custom-built power supply or provided as separate devices. A typical unit has a response time of 3-5 microseconds and is capable of discharging five microfarads in approximately one millisecond at 20 KV.

CALIBRATED SPARK GAPS provided with micrometer calibration and may be used for determining crest voltage.

HIGH VOLTAGE OUTPUT BUSHING. Oil filled and terminated with anti-corona toroids, these devices are designed for oil-to-air outlet of very high voltages; available in two ratings, 300 and 600 KV D.C.

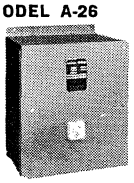
MODEL A-26



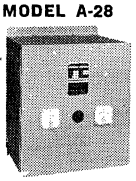
DESIGN FEATURES

1. Automatic in operation and self-regulating.
2. No moving parts. Nothing to arc or wear out.
3. No external controls. Cannot be tampered with.

The La Marche A-26 power supply features automatic load regulation and semi-automatic current limiting. The model A-26 is filtered to 10% ripple. There are no controls to be set for different applications because the amount of loading determines the current output.

The La Marche model A-26, like all La Marche units, is a solid state device employing a balanced isolation power transformer, a magnetic amplifier and sealed silicon diode rectifiers. These power supplies have no contacts, relays, switches, fans, tubes, time clocks or other moving parts.

MODEL A-28



DESIGN FEATURES

- Silicon diode rectifiers.
- Current limiting circuit.
- Automatic A.C. voltage compensation.
- D.C. voltage regulation.
- Output ammeter and voltmeter.

The model (A-28) is a solid state, fully automatic, constant voltage D.C. power supply designed for all regulated applications.

Standard features include automatic A.C. line compensation, D.C. voltage regulation and current limiting. The La Marche transistor controlled magnetic amplifier circuit is designed to automatically provide a D.C. output regulation of ±5" from no load to full rated output. Accurate output regulation is maintained with A.C. line variations of ±10%. The A-28 is offered in a wide range of sizes and voltages.

The reliability of the La Marche circuit has led to its selection for critical communication and control systems, nuclear powered ships, missile firing stations, and utility power standby systems.

FLOAT BATTERY CHARGERS

LA MARCHE

GENERAL DESCRIPTION

The model A-11 Float Battery Charger is a completely automatic, solid state, constant voltage device having:

A.C. VOLTAGE COMPENSATION — D.C. VOLTAGE REGULATION — CURRENT LIMITING

The model (A-11) charger is designed and built to carry continuous and intermittent loads up to its maximum rated output. The A-11 is current limited at 140% of rated output. Each unit is designed and built to charge a specific type of battery containing a specific number of cells.

The La Marche Transistor Controlled magnetic-amplifier circuits provide continuous taper charging. Maintains rated output voltage within ±1% from no load to full load with A.C. input variations of ±10%. Silicon diodes are used for rectification.

The model A-11 charger floats lead-acid batteries at 2.17 volts per cell and by means of a front panel switch equalizes at 2.33 volts per cell. Both float and equalize voltages are adjustable to meet battery manufacturers recommendations. This type of charging imparts the longest battery life and is the accepted method for charging batteries used in standby service.

DESIGN FEATURES

1. Quality parts throughout. Silicon diode rectifiers and transistor magnetic amplifiers used exclusively.
2. A.C. power loss relay, output voltmeter/ammeter and fused input-output are standard on all models.
3. Eighty sizes available in five input voltages.

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem**, the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

Lambda has over 10,000 power supply units on-the-shelf for 1-day delivery. Every one fully guaranteed for 5 years . . . material and labor.

Lambda's LPD series offer more amps per $ than any other general-purpose dual lab supply.

also available with single output... LP series

Features of LPD series dual output power supply

5 models with two independent DC outputs
up to ±250 vdc, up to 1.7 amps. Either output may be + or − or both outputs may be + or −

Series/parallel operation
of both outputs yields two times the voltage or two times the current—up to 500 volts or up to 3.4 amps.

Auto series/auto parallel (master-slave)
permits tracking to a common reference.

4 meters
provide simultaneous monitoring of both voltage and current.

Regulation
line or load .01% + 1 mv.

Ripple
500 μv rms (1.5 mv p-p)

A-C input
105-132 vac 47-440 Hz (ratings based on 57-63 Hz operation). For operation at 205-265 vac, add suffix "-V" to model numbers and 10% or $25.00 (whichever is greater) to price.

Multi-current-rated
Bench or rack use
Remotely programable
Remote sensing
Designed to meet RFI per MIL-STD-826A

Fungus-proofing option
add suffix "R" to model number and add $15.00 to price.

Overvoltage protection
available as an option up to 70 vdc

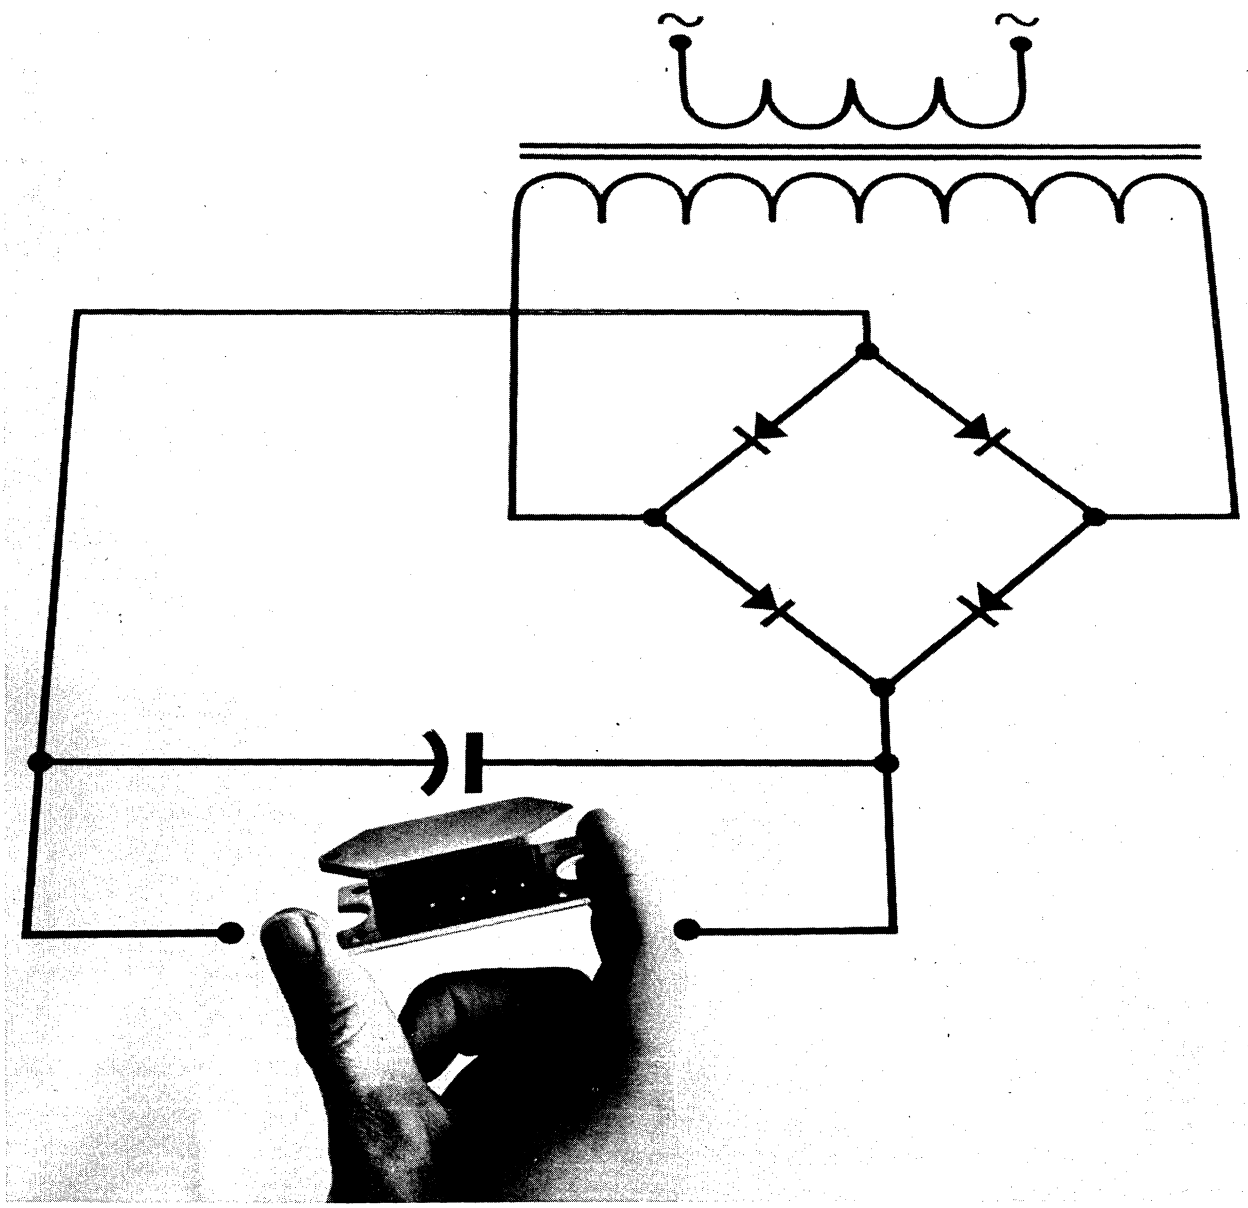
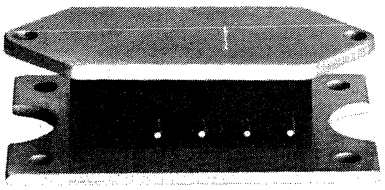
LAMBDA POWER HYBRID VOLTAGE REGULATORS

The world's first... 22 models... 5 volts 5 amp model @ $20 in quantities of 100





"actual size"

DO YOU FACE A "MAKE OR BUY" DECISION ON POWER SUPPLIES?

A revolutionary development by Lambda offers you improved power supply performance at lower cost whether you "make" OR "buy." It is the Series LAS2 Power Hybrid Voltage Regulator, which provides 0.1% line or load regulation for any DC power supply with output ratings up to 28V and 5A.

The Power Hybrid Voltage Regulator replaces all discrete components of conventional regulator circuitry. It converts any source of filtered DC into a regulated power supply. Designed and built by Lambda in a new microelectronic facility, the Power Hybrid Voltage Regulator is available as a separate component for the buyer or builder of custom power supplies. It is also incorporated in many of Lambda's off-the-shelf supplies and in Lambda's power kits.

What it is

The Series LAS2 Power Hybrid Voltage Regulator utilizes cermet thick-film resistors, capacitors and monolithic integrated circuits, and power transistors in chip form, to achieve optimum regulator performance at minimum cost.

A key feature of its construction is the high degree of thermal isolation between the heat generating power elements and the heat sensitive control and reference elements. This thermal isolation results in extremely low thermal drift characteristics for changes in power levels. In addition, a unique thermal power limiting circuit is built into the power section of the unit for increased operational reliability.

What it offers

The Power Hybrid Voltage Regulator allows the power supply builder to achieve rock-bottom simplicity in his design. This is one of its major advantages. The regulator package, occupying about 2.5 cubic inches of space, replaces all of the transistors, diodes, resistors, capacitors and circuit boards of present-day voltage regulators. 22 electrical configurations provide exceptional versatility to meet specific design requirements.

For the builder of power supplies . . .

this means lower cost at every stage of production: lower engineering costs, simpler incoming inspection, smaller and simpler parts inventory, lower manufacturing costs. Of course, these same benefits accrue to us as a manufacturer of regulated power supplies. This is why we can offer a wide range of high-performance packaged supplies at moderate cost.

For the user of power supplies...

the Power Hybrid Voltage Regulator means, above all, unequaled reliability. The advantages of ICs over discrete circuitry need no elaboration. Moreover, this ruggedly packaged unit is less susceptible to physical damage than exposed IC or discrete components, thus, longer MTBF is achieved. If a malfunction should occur, the low cost of the Power Hybrid Voltage Regulator makes it economically practical to simply replace the entire unit.

Each of the three volumes of **eem** contains a Product Index and Directory, the Green Section. This Index is a complete alphabetical listing of products. If the product you are looking for appears in the particular volume you are consulting, the green pages will provide a complete list of manufacturers who make that product. If the product is included in another volume of **eem**, the Index will provide a cross reference, directing you to the correct volume.

Boldface listings under product headings indicate that the listed manufacturer has products cataloged in **eem. Boldface** listings with page numbers indicate that this manufacturer's catalog pages include detailed data on the product indicated in the product heading.

Similar products are grouped together. For example, the many kinds of meters are listed in this manner: "Meters, Ampere," "Meters, Capacitance," "Meters, Flux" etc. To help you locate the prime product heading, there are hundreds of cross references, e.g. "Voltmeters — See Meters, Volt."

** Available with 210-250 Volts input at half input current shown in chart above (no extra charge). When ordering specify model number followed by (-230) suffix, i.e. TFC-26-200-230.

† Available with 198-242 Volts input at 15 amps input current at no extra charge. When ordering specify FC-115-1000-220.

VOLTAGE STABILITY: After a ½ hour warm up with constant load and constant ambient temperature, the voltage will not drift more than 0.1% for an 8 hour period.

VOLTAGE TEMPERATURE COEFFICIENT: After a ½ hour warm up with constant load the average temperature coefficient will not exceed 0.1%/°C.

FREQ. STABILITY: After a ½ hour warm up with constant load, and constant ambient temperature, the frequency will not drift more than 0.2% for an 8 hour period.

FREQUENCY TEMPERATURE COEFFICIENT: After a ½ hour warm up with constant load, the average temperature coefficient will not exceed 0.05%/°C.

METERS: Ammeter and voltmeter furnished. Meters are accurate to 3% of full scale rating.

POLARITY: All supplies can be floated up to 500V peak off ground. Either line may be grounded to the chassis ground terminal provided.

DUTY: Continuous at unity power factor at ambient temperatures from 0° to 45°C for FC models and 0° to 40°C for TFC models (35°C at 50 cps input). FC models may be operated above 45°C provided that the output current is derated linearly to zero at 60°C. Consult factory for derating characteristic on TFC models.

REMOTE SENSING: The FC Supplies are provided with circuitry to sense and regulate the voltage at the load rather than at the output terminals, eliminating the otherwise unavoidable load regulation due to the resistance of the wire connecting the supply to the load.

REMOTE PROGRAMMING: The output voltage and/or frequency may be accurately controlled from a remote point, if desired, by inserting a resistance across "Remote Program" terminals provided on rear.

OUTPUT ADJUSTMENT: Output Voltage and Frequency adjustments are accomplished by a dual potentiometer on front panel.

EXTERNAL SYNCHRONIZATION: All models may be synchronized to an external standard by the use of terminals on rear of chassis.

TERMINATION: A barrier type terminal strip is provided at the rear of the unit for all input, output, sensing, remote programming and external synchronization connections. Output is also available on the front panel through binding posts.

PROTECTION: During overloads or short circuit the load is electronically **disconnected** on FC models and electronically **limited** on TFC models. If the overload persists on TFC models, the load is disconnected from the supply by a fuse. Internal components are protected by an automatic resetting thermal switch.

MOUNTING: All Models supplied with full dust cover. All Models except the two 100VA units are supplied as 19" rack equipment: The 100VA units are supplied for laboratory bench use. Rack mounting is obtainable by means of the following rack adapter panels.

RP1 — 5¼" high. 19" wide, with cutout for one unit.

RP1A — Same as RP1 except cutout is offset to leave half of panel blank.

RP2 — 5¼" high. 19" wide, with cutouts for two units.

FINISH: Front Panel finished in dark grey enamel equivalent to FED STD 595 Chip No. 26132. Marking is white. All other finishes are appropriate paint, plating or chemical film as required.

INSPECTION: MIL-I-45208A.

OPTIONAL FEATURES:

The following optional features are available on any given unit. Consult Field Representative for option prices not provided on price page.

MULTIPHASE OPERATION: Single phase models can be combined to produce a three phase 4 wire or two phase 4 wire output, by using the multiphase adapters which have a maximum phase shift of 2.5° per phase and maximum line to line output distortion of 3%. When operating in the multiphase mode the single phase regulation and VA specifications become the line to neutral specifications.

TUNING FORK: For frequency stability up to 0.005%. Can be mounted within units on all models except 100 VA units.

Bench Adapter: Available for all 19" rack models up through 8¾" panel sizes. Add suffix (-B) to model number.

Power Cord: All models available with power cord. Add suffix (-P) to model number.

TRANSIENT RECOVERY TIME: Less than 50 micro second to recover to within the regulated region for line changes of ±10% around nominal, or ±50% load changes around nominal.

CURRENT PROTECTION: Electronic current regulation that will protect load and also provide current regulation within 1%; internally adjustable over a range of 10% to 120%.

REMOTE PROGRAMMING: RSA-07A, B, C (500Ω/V); RSA-015A, B, C, 032 (600Ω/V); RSA-024, 060, 0120 (800Ω/V)

REMOTE SENSING: Sensing terminals separate from the load terminals provide regulation against the voltage at the load rather than the voltage at the power supply output terminals. This eliminates the otherwise unavoidable load regulation due to the voltage drop in the wires connecting the supply to the load.

COOLING: Convection cooling on all models.

CONTROLS: Voltage and optional overvoltage controls.

OPTIONS

(—OVP) OVER VOLTAGE PROTECTION: Crowbar to limit maximum output voltage. Normally factory set at 3.0V above the maximum voltage. Adjustable over range as specified in chart above.

(—230): Change in normal input voltage to 205-265 VAC.

(—E): Mil. type conformal coating over all P.C. boards.

TEMPERATURE RATINGS:

Operating Temperature: —20°C to 71°C
Storage Temperature: —55°C to 85°C

STABILITY: Less than 0.1% total drift for 8 hours following a 30 minute warm-up under constant ambient conditions.

OVERSHOOT: No voltage spikes for turn on-turn off or power failure.

TRANSIENT RECOVERY TIME: Less than 50 micro second to recover to within the regulated region for line changes of ±10% around nominal, or ±50% load changes around nominal.

OVERLOAD PROTECTION: Electronic overload and short circuit protection with automatic reset upon removal of load, internally adjustable from 75% to 125% of max. rating.

REMOTE PROGRAMMING: 1 volt/per volt or 500 ohms/per volt (output terminal strip).

REMOTE SENSING: Sensing terminals separate from the load terminals provide regulation against the voltage at the load rather than the voltage at the power supply output terminals. This eliminates the otherwise unavoidable load regulation due to the voltage drop in the wires connecting the supply to the load.

COOLING: Convection cooling on all models.

CONTROLS: Voltage and optional overvoltage controls.

OPTIONS

(—OVP) OVER VOLTAGE PROTECTION: SCR crowbar to limit maximum output voltage. Normally factory set at 1.5V or 20% (whichever is greater) above the nominal voltage range.

(—230): Change in normal input voltage to 205-265 VAC.

(—E): Mil. type conformal coating over all P.C. boards.

(—M): Meters (RSF, G, H) have optional meters available—Prices shown are less meters.

(—Y): High Performance option provides full .01% regulation, improved temp. coefficient, and improved stability.

(—R): Redundant operation. NJE can provide a modification to the power supply that will allow for (2) power supplies to operate in parallel and become redundant. Decoupling diodes, and circuit modification all for complete performance to specifications, with diodes being within the supply loop. (Consult factory for prices and details.)

Higher current ratings can be provided if forced air or reduced line voltage conditions are available.

Additional ratings can be adapted for RS models, by slight modifications of standard models. (Example: RSB-5 can be modified to provide 6V @ 5A.)

NJE has many discount plans that will fit your individual needs—OEM contract plans also available.

SPECIFICATIONS:

Input: 105-130 Volts, 47 to 420 Hertz, single phase.

Static Current Regulation
(High Performance) **HP option**
Load: At constant input voltage, the current regulation in this High Performance mode is increased to 0.01% or 250 micro-amps by a jumper on rear barrier terminal board.

MODE OF OPERATION
Constant current and constant voltage levels may be preset with the maximum rating as listed in Table 1.

Ripple (Voltage Regulated Mode)
250 Microvolts rms from D-C to 10 Megahertz.

Ripple (Current Regulated Mode)
500 microamps rms.

TRANSIENT RESPONSE
For a no load to full load or a full load to no load step change, the output voltage will return to within 10 millivolts in less than 50 microseconds.

METERS
Three-range voltmeter and three-range ammeter are provided on the front panel.

POLARITY
The output may be floated up to 500 volts peak above ground. Either polarity may be grounded to chassis by means of terminals provided.

DUTY
Continuous at ambient temperatures from 0°C to 60°C.

Remote Sensing: Sensing terminals separate from the load terminals provide regulation against the voltage at the load rather than the voltage at the power supply output terminals. This eliminates the otherwise unavoidable load regulation due to the voltage drop in the wires connecting the supply to the load. This feature does not eliminate voltage excursions resulting from load transients through the load line impedance.

Remote Programming: Voltage Output: The output voltage may be controlled accurately from a remote resistance or voltage, across the "remote voltage programming" terminals in the rear of the power supply. Resistance sensitivity is 200 ohms/volt.

Current Output: The output current may be controlled accurately from a remote resistance connected across the "remote current programming" terminals.

Termination: Barrier-type terminal strips at the rear of the unit provide interface connection for output, remote sensing, remote programming, tracking, HP option, and grounding. Input line cord with three-prong, in-line safety plug is provided. Front panel binding posts for output and ground are provided in addition to the output terminals at the rear.

Parallel Operation: Two like units may operate in parallel to provide twice the rated current of a single unit. Master-slave operation with single output control is provided.

Tracking: Two or more units may be connected in series, parallel or with one common voltage point and controlled with a single output control and referenced to one supply's reference voltage. This connection requires the addition of tracking resistors.

OVERVOLTAGE PROTECTION OPTIONS
OVPA: Addition of an overvoltage protection circuit which will "Crowbar" the output terminals when a pre-set voltage level is exceeded. OVPA attaches to front of unit on existing output terminals. Overvoltage protection range is from approximately 6 volts to 10% above rated voltage of the supply.

OVPB: Same as OVPA option, except unit is mounted adjacent to rear terminal strips.

Protection: Load and power supply protection for any overload condition is provided by the current limiting inherent in the automatic crossover-constant current design. Protective fuse will interrupt input power in the event of internal failure.

Resolution: Continuously variable coarse and vernier output voltage adjust potentiometers provide the resolution indicated in Table 1.

MULTI-UNIT CROSS CONNECTION
Series operation: Two or more units may be operated in series to provide higher output voltage at rated current. Each unit functions independently.

The SVC line of power supplies provides the user with a double-barrelled utility — All-Silicon design plus the capability for operation in Voltage and/or Current Regulation mode. This represents the ultimate in flexibility of operation for today's laboratory requirements and sophisticated system use. Featuring full-range adjustability in Lab-Rak (Laboratory Bench Units, Rack Adaptable) or full rack construction, SVC Power Supplies are undoubtedly the last word in versatility and reliability.

Design Concept: All Silicon, Series, Regulator, SCR Buffer, Closed Loop Transistorized Amplifier.

SPECIFICATIONS:

INPUT: 105-125V, 55 to 65 cps, single phase.

OUTPUT VOLTAGE AND CURRENT: See Table 1.

STATIC REGULATION:

Load: At constant input voltage, the regulation is less than the figure indicated in Table 1 for a load change from half load to full load and is less than the figure indicated in Table 1 for a load change from half load to no load.

Line: At constant load, the regulation is less than the figure indicated in Table 1 for a line change from 115 to 105V and less than the figure indicated in Table 1 for a line change from 115 ot 125V.

RIPPLE: Constant Voltage Mode: 1 millivolt RMS maximum.
Constant Current Mode: 1 millivolt RMS maximum (To determine current ripple divide 1 mv RMS by load impedance).

TRANSIENT RESPONSE: For a ±10 volt step change in line voltage, within the limits of line voltage as specified above, the output voltage will remain in the regulated region. For a no load to full load or a full load to no load step change, the output voltage will return to within 20 millivolts of the regulated region in less than 20 microseconds except for models whose output currents are greater than 10 amperes in which case the output voltage will return to within 20 millivolts of the regulated region in less than 30 microseconds.

METERS: Basic models do not include meters. Two pin jacks are provided on the front panel to monitor the output voltage. For metered models see Optional Features, Suffix (-M).

POLARITY: The output may be "floated" up to 500V peak above ground. Either polarity may be grounded to chassis by means of terminals provided.

DUTY: • Lab-Rak and 3½" panel height models. Continuous full load at ambient temperature from 0°C to 60°C in still air, and up to 71°C when a minimum of 150 CFM (100 CFM for Lab-Rak units) of air-flow is provided. Operation above these temperature limits under these conditions is allowed provided the output current is derated linearly to zero at 85°C.

• 5¼" Panel Height Models. Continuous full load at ambient temperature from 0°C to 60°C in still air. Operation above this temperature is allowed provided the output current is derated linearly to zero at 85°C.

REMOTE SENSING: (For Constant Voltage Mode Only). Sensing terminals separate from the output terminals, provided sensing and load regulation against the voltage at the load rather than the voltage at the power supply output terminals. This eliminates the otherwise unavoidable load regulation due to the voltage drop in the wires connecting the supply ot the adjacent load.

REMOTE VOLTAGE PROGRAMMING: The output voltage maye be controlled accurately from a remote point if desired, by inserting a resistance across the REMOTE PROGRAM (VOLTAGE) terminals. The sensitivity of this circuit is approximately 125 ohms per volt within the voltage limits of Table 1, except for the 125 volt units in which the sensitivity is 160 ohms per volt.

REMOTE CURRENT PROGRAMMING: The output current may be controlled accurately from a remote point if desired, by inserting a resistance across the REMOTE PROGRAM-(CURRENT) terminals. The sensitivity of this circuit is indicated in Table 1.

DUALLING: Two or more units may be operated in series to provide higher voltage output at rated current. Units of the same voltage and current ratings may be operated in parallel.

TERMINATION: A barrier type terminal strip at the rear of the unit provides interface connection for input, output, remote sensing, remote programming, dualling and ground. Front panel binding posts for output termination in addition to the output terminals at the rear are provided.
Lab-Rak units are provided with a three wire input power cord and plug.

PROTECTION: Overload protection is provided by the MODE OF OPERATION as discussed below. Protective fuse will interrupt input power in the event of component failure. Short circuit protection 100% factory tested.

IMPROVED TRANSIENT: Improved transient response and dynamic characteristics at the sensing location may be achieved by removing terminal board jumpers and installing suitable capacitance at the load.

MODE OF OPERATION: Constant current and constant voltage levels may be preset within the maximum rated voltage and current levels specified in Table 1. Referring to the graph of Figure 1 on page 9, the intersection of the constant voltage and constant current operation lines, called the "Crossover Point", may be located anywhere within the output volt-ampere range of the unit. Regardless of the demands of the load, the output voltage and/or the output current will never exceed the limits preset by the output voltage and output current controls.

MODE INDICATION: The power supply's operating mode is indicated by a pair of front-panel signal lamps. One lamp is lighted during voltage regulated operation, the other during current regulated operation. Crossover from one mode to the other is signalled by the extinction of one lamp and the lighting of the other.

RESOLUTION:

- **Voltage Adjust:** Continuously variable coarse and vernier VOLTAGE ADJUST potentiometers on concentric shafts provide the resolution indicated in Table 1.
- **Current Adjust:** Continuously variable coarse and vernier CURRENT ADJUST potentiometers on concentric shafts provide the resolution indicated in Table 1.

AIRFLOW: Units with panel height of 3½" and ⅓ rack units do not have blowers and depend on conduction and convection for cooling. Units of 5¼" panel height have internal blowers to provide forced air cooling in addition to the conduction and convection cooling.

MOUNTING:

- 3½" and 5¼" panel height models are provided with standard 19" relay rack mounting notched per MIL STD 189.
- Lab-Rak units are designed for bench operation. Optional rack adapters 8¾" high x 19" wide for standard relay rack mounting notched per MIL STD 189 are available as follows:
  1) NJE model RP4 Rack Adapter to mount one Lab-Rak unit offset to the left, providing additional panel space for customer use.
  2) NJE model RP3 Rack Adapter to mount up to three Lab-Rak units. Unused openings can be covered with cover plate, Model CP-1. Order as required. (See Pix above.)

  Lab-Rak cabinets with blank front and rear panels may be purchased to provide housing for other circuit applications. List price found on page 26. NJE will be pleased to provide custom quotations for piercing and blanking of front and rear panel.

FINISH: Front panel finished in dark grey enamel equivalent to FED STD 595 chip #26132. Panel marking is white. Surfaces of external sheet metal are environmntally protected with yellow iridite or chromate plating. All other finishes are appropriate paint, plating, or chemical film as required.

INSPECTION: MIL-I-45208A.

DEVIATIONS: NJE Corporation invites requests for quotations on special requirements which can be accomplished by deviations of standard catalog units.

OPTIONAL FEATURES:

The following optional features are available on any given unit. Consult Field Representative for option prices not provided on price page 26.

Suffix (-OV): Addition of SCR crowbar overvoltage protection circuit. Upon actuation of the overvoltage trip circuit, the output voltage is clamped and reduced to a low value. The overvoltage trip point is factory preset 5% above the maximum rated supply voltage unless otherwise specified. The trip voltage point may be reset to any value above 10 volts by means of a simple internal adjustment fully described in the Instruction Manual.

Suffix (-KI): Enables operation at input frequency of 50 Hz. Nominal input voltages of 115, 208, 220, 230 or 240 V at 50 Hz can be provided. The power supply will be wired and tested with the specific Input Voltage as designated by the customer. However, simple internal tap changes allow for re-wiring to any of the available voltages.

Suffix (-B): Addition of bench adapter. (For 3½" and 5¼" high units.)

Suffix (-SF): Non-standard finish to front panel of unit. Where specifying (-SF) option customer must provide NJE the following information: Color to be used (preferable FED STD 595 chip number). Color to be used for marking. Process to be used if other than NJE standard finish process. Whether paint is to be supplied by customer or NJE.

Suffix (-LV) and/or (-LC): Control for VOLTAGE ADJUST (-LV) or CURRENT ADJUST (-LC) replaced by a single turn screwdriver adjust potentiometer with shaft-lock.

Suffix (-M): Addition of meters, ±2% full scale accuracy.

Suffix (-P): Addition of three wire power cord and plug on full rack units. (Power cord and plug is furnished as standard equipment on Lab-Rak units.)

Suffix (-TTV): Replacement of standard VOLTAGE ADJUST potentiometer by a ten-turn continuously variable potentiometer with a decade dial and lock providing an improved resolution of 0.02%.

Suffix (-TTC): Replacement of standard CURRENT ADJUST potentiometer by a ten-turn continuously variable potentiometer with a decade dial and lock providing an improved resolution of 0.025%.

Suffix (-TTVC): Replacement of both standard VOLTAGE & CURRENT ADJUST potentiometers by ten-turn continuously variable potentiometers with decade dial and lock. Resolution per suffix TTV and TTC above.

NOTE: Example of buildup of final model number for SVC-40-10 with meters and three wire power cord and plug is as follows:

UNIPLY® A LABORATORY OF POWER SUPPLIES IN A SINGLE PACKAGE

• UNIPLY® is a regulator technique which functionally permits replacement of five regulated DC power supplies with a single instrument, providing features hitherto unavailable in conventional units. • Output voltage and current ranges cover a broad spectrum of laboratory requirements for both digital and analogue applications. • Ranging is transient-free and automatic with changes in load and the setting of voltage and current controls. Operation is completely electronic, without relays or manual switching. • For operation with low voltage digital circuits the automatic ranging feature may be restricted to 6 volts by means of a panel switch. In the 6 volts position the range of the panel voltmeter is automatically reduced to 6 volts full scale. • The RFI-free regulator system employs linear circuits only. No SCR's, switching transistors or high frequency techniques are utilized. • Power output capability of the supply increases with increasing AC line voltage over 105 volts. Useful regulated output at reduced levels is available down to a line voltage of 85 volts. • A flashing panel indicator signals inability of the supply to meet load demands in excess of control settings or the inability of the AC line voltage to support increased output levels. • The supply may be operated continuously into an overload or short circuit without damage. • Regulator efficiency is superior to conventional, wide voltage range, dissipative type systems.

HOW TO ORDER POWER/MATE OEM POWER SUPPLIES

To specify voltage and current, including those not listed, place the required voltage after OEM-, and the current after the case size A, B, etc. For example: OEM-34C-2.25 or OEM-5-HOV for over voltage.

AVAILABLE OPTIONS

1. Built-in over-voltage protection at $30 per unit. Use suffix "OV."
2. Fungus proofing, with MIL-V-173 varnish, for all fungus nutrient components, at $10 per unit. Use suffix "FP."
3. AC input. All units are available with 208 VAC ±10% (use suffix "L") or 230 VAC ±10% (use suffix "LL") at no extra cost.
4. Dual AC input. All units are available with 208 VAC and 230 VAC (use suffix "Y," at $25 per unit).

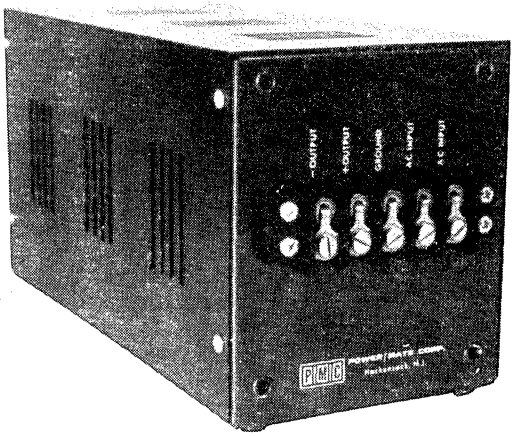
Pioneers of the UNI concept in power supplies

FPS Series FERRORESONANT REGULATED DC POWER SUPPLIES



FEATURES:

- High efficiency—70-90%
- Low cost
- High reliability—over 150,000 hours MTBF
- Short circuit proof
- High-quality components
- All silicon semiconductors
- Built-in limiting for over-voltage and over-current
- Operate in series parallel
- Compatible with standard PMC Power Supplies and Accessories

FPS Series units supply DC outputs from 5 to 48 volts, with currents to 25 amps. The inherent simplicity of design of these supplies greatly increases their reliability. Components are conservatively rated to further assure optimum performance. All FPS units may be used with the standard Power/Mate racks and metered accessories.

An extra low ripple version is offered in which the output ripple is reduced below that of standard FPS models. This is denoted by the suffix "F" after the model number (example: FPS 15-12F). The added filtering increases the unit length by four inches. Case size, FCF.

SPECIFICATIONS:

ACCURACY: ±2%, measured at 115 VAC, full load, 30°C. Initial cold output is 1% higher.

REGULATION LINE: ±1%, for ±15 volt AC line variation, at 25-100% load. For loads below 25%, line regulation is +1.5% output change.

REGULATION LOAD: Refer to specific model on chart at right.

STABILITY (8 hr.): 1% or 0.1V, whichever is greater.

TEMPERATURE COEFFICIENT: 0.05%/C°.

INPUT: 115 VAC-., ±15 VAC-., 60Hz ±5% single phase. Input frequency variations produce an approximate equal percentage output voltage change.

AMBIENT OPERATING TEMPERATURE: —20°C to +55°C.

RACKS and ACCESSORIES

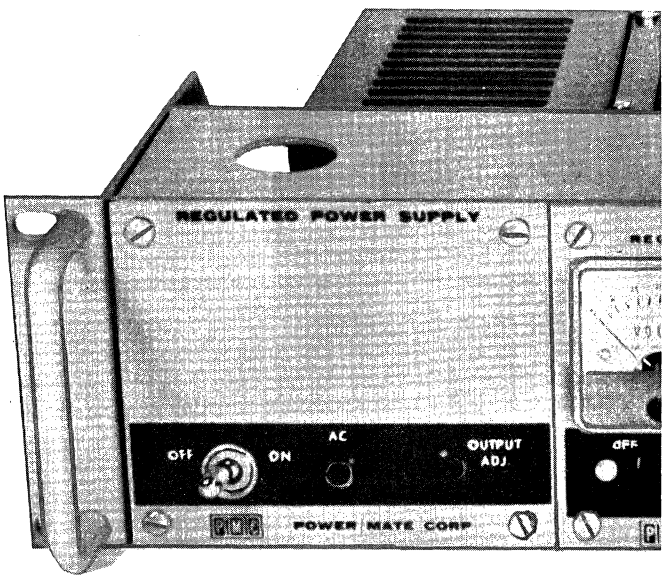
PRODUCT DIGEST

All PMC racks and accessories accommodate a variety of PMC modules in any configuration in a standard 19" rack, 3½" high or 5¼" high, with 5 different styles. All of the racks and panels are finished in durable baked gray enamel, with predrilled and tapped holes, ready for easy assembly.

THE PMC "BUILDING BLOCK" APPROACH

Because most PMC power supply modules are compatible with PMC racks, panels and other accessories, an infinite variety of combinations is possible to produce the exact requirements of the application. Assembly of a CUSTOM power supply, instead of specifying a "special order," gains the substantial benefits of lower cost and the use of industry proven and accepted PMC power supplies.

This approach also gives the engineer a new dimension in design freedom. He chooses from readily available, off-the-shelf, standard modules (at standard prices), and from matching off-the-shelf mounting racks, metered and non-metered control panels, in addition to the complete assortment of other accessories.



PANELS

HOW TO ORDER PANELS: Select desired voltmeter range and ammeter range from listing below. Insert voltmeter range selected in first bracket, followed by ammeter range. For example, a CPM-525-36-1.5 indicates a metered quarter rack panel with a 0-36 voltmeter and a 0-1.5 ammeter.

HOW TO SELECT RACKS TO FIT YOUR MODULES

1 Select the POWER/MATE power supply modules of either the UNI or OEM Series, which will satisfy the electrical requirements of your application.

2 From TABLE A, list the effective width and depth of each module selected. Arrange in a list so that the effective width can be readily added up.

3 To make the general applicable rack selection, compare the models selected in Step 1 with the module types shown for each type of rack from TABLE B.

4 Add up the effective width of the modules from Step 2. Also note the maximum effective depth of the modules.

5 Check the maximum effective depth of the modules against the depth shown in TABLE C. This will indicate if the maximum effective depth is within the capacity of the rack type selected.

6 Next, compare the total module width and the width dimensions in TABLE C for the selected rack type. This will determine if the total effective width of the power supplies required will fit within the rack.

If the total module width is larger than that of the rack selected, then two choices are available: a) use two racks, or b) place more than one similar case width power supply (See TABLE A) in tandem. For example, two B cases with an individual depth of 7⅝ can readily fit in the 19⁹⁄₁₆ depth of the AR525-21 rack.

TABLE A

DESCRIPTION

POWER/MATE's new HE high efficiency series, utilizing POWER/MATE's "SIMAG" circuitry (patent pending), a breakthrough in power supply design, are the result of a development program to provide a high efficiency series of power supplies for use with digital (TTL, ECL, TRL, DTL, and HTL) integrated circuits and MOS/LSI logic.

The new series operates at efficiencies greater than 50% and are offered in a wide range of voltages up to 150 VDC with current ratings up to 200 amps.

POWER/MATE's unique mechanical and electrical design allows the power supplies to be packaged in almost half the space required for equivalent conventional series power supplies.

Built-in overvoltage protection and self-restoring current limiting provide complete protection. Advanced electronic circuitry limits the output current on external loads, including short circuit providing protection for the load as well as the power supply. Remote sensing, remote programming and complete serviceability are additional features.

The HEV and HEW Series are backed by POWER/MATE's Five Year Warranty.

SPECIFICATIONS (HEW SERIES)

The specifications for the HEW Series are identical to those of the HEV Series except that:

OUTPUT VOLTAGE: Refer to applicable charts.

LINE REGULATION: 1.0% for line variations from 105-132 VAC.

LOAD REGULATION: 1%, for a 20% load to full load or full load to 20% load; or 1% full load to no load with a 20% pre-load throughout the voltage adjust range.

RIPPLE: 150 mv RMS or 1% of output voltage, whichever is greater.

OVERLOAD PROTECTION: (Electrical) External overload protection: fixed, automatic electronic current limiting circuit limits the output current upon external overloads, including short circuit, thereby providing protection for load as well as power supply. In addition, an automatic thermal reset switch is incorporated to sense overtemperature.

OVERVOLTAGE PROTECTION (OPTIONAL): Built-in continuously adjustable overvoltage protection crowbars output when trip level is exceeded. Optional on all models. Add suffix OV to model number and $50 to price.

INTEGRATED CIRCUIT POWER SUPPLIES

PRODUCT DIGEST

ICX Series power supplies, using IC regulators, are designed expressly for integrated circuit applications, with components industrially rated for long life. They provide adjustable voltage ranges, DC outputs of 3.6 to 16 volts and from 1.5 to 25 amperes, and regulation of ±0.1% line and load. These competitively priced units use an open-chassis construction for economy, providing all the essentials for high reliability with no unnecessary extras. For added flexibility, optional features are available.

The heart of the ICX Series power supplies is a custom-designed integrated circuit which includes: a reference source, a voltage regulator, and a current regulator to make each power supply completely short circuit and overload proof. A built-in adjustable SCR crowbar protects against overvoltage.

The ICX units are equipped for remote or local sensing, and they are remotely programmable.

They have two mounting surfaces, and the ICX Series may be used with PMC standard accessories (see pages 20-23).

The ICX power supplies, with top-quality components and all-silicon semiconductors, are backed by the same 5-Year Warranty given to all POWER/MATE CORP. power supplies.

SPECIFICATIONS

INPUT: 105-125 Volts, 47-420 cps, single phase.

OUTPUT VOLTAGE AND CURRENT: See Respective Tables.

REGULATION:
Load: The regulation for load changes is less than .01% or 1 millivolt, whichever is greater from no load to full load.
Line: The regulation is less than 0.01% or 1 millivolt, whichever is greater, for a line change from 125V to 105V at constant load.

RIPPLE: Less than 250 microvolts.

TRANSIENT RESPONSE: For a ±10 Volt step change in line voltage or for a no load to full load, or a full load to no load step change, the output voltage will return to within 10 millivolts of the regulated region in less than 20 microseconds.

METERS: Voltmeter and ammeter, rated accurate to 2% of full scale value, are provided on the front panel.

POLARITY: The output may be "floated" up to 300V peak above ground. Either polarity may be grounded to chassis by means of terminals provided.

CONSTANT CURRENT/CONSTANT VOLTAGE: Constant current and constant voltage levels may be preset within the maximum rated voltage and current levels specified in appropriate tables. The intersection of the constant voltage and constant current operation lines called the "Crossover Point" may be located anywhere within the output volt-ampere range of the unit. Regardless of the demands of the load, the output voltage and/or the output current will never exceed the limits (1% or better) preset by the output voltage and output current controls.

CONTROLS
VOLTAGE: Continuously variable coarse and vernier DC OUTPUT ADJUST potentiometers on concentric shafts provide variable DC Output.
CURRENT: Continuously variable single turn potentiometer provides current limiting adjustment.
